

Technical Manual N5

Fieldbus: EtherNet/IP[™]

For use with the following devices: N5-1-3, N5-2-3

Valid with firmware version FIR-v2039 and since hardware version W007

Technical Manual Version: 3.2.0

Contents

1 Introduction

The *N5* is a controller for the *open loop* or *closed loop* operation of stepper motors and the *closed loop* operation of BLDC motors.

This manual describes the functions of the controller and the available operating modes. It also shows how you can address and program the controller via the communication interface.

You can find further information about the device on the Nanotec homepage us.nanotec.com.

1.1 Version information

Manual version	Date	Changes	Firmware version
1.0.0	08.04.201	6 Edition	FIR-v1614
1.0.1	22.07.201	6 Additions and error corrections	FIR-v1626
2.0.0	01/2018	 New chapter <u>Environmental conditions</u> New chapter <u>Control modes</u> New chapter <u>Limitation of the range of motion</u> New chapter <u>Cycle times</u> Revision of chapter <u>Commissioning</u> Additions and error corrections 	FIR-v1650
2.0.1	08/2018	Additions and error corrections	FIR-v1650
3.0.0	12/2018	New firmware generation	FIR-v1825
3.1.0	10/2019	 New firmware generation: see document <i>Instructions for firmware update to version: FIR-v1939.</i> New chapter <u>Configuring the sensors</u> Changes and additions in chapter <u>Closed Loop</u> New sections in chapter <u>Control modes: Controller structure, Feed forward, Assignment of the feedbacks to the control loops and Slow Speed</u> Addition to the connection data for the connectors Minor additions and error corrections in the object dictionary 	FIR-v1939
3.2.0	11/2020	 New firmware generation: see document <i>Instructions for firmware update to version: FIR-v2039.</i> New chapter <u>Analog inputs</u> 	FIR-v2039

1.3 Intended use

The *N5* serves to control stepper motors and BLDC motors and is used as a component in drive systems in a wide range of industrial applications.

Use the product as intended within the limits defined in the technical data (in particular, see <u>Permissible</u> <u>operating voltage</u>) and the approved <u>Environmental conditions</u>.

Under no circumstances may this Nanotec product be integrated as a safety component in a product or system. All products containing a component manufactured by Nanotec must, upon delivery to the end user, be provided with corresponding warning notices and instructions for safe use and safe operation. All warning notices provided by Nanotec must be passed on directly to the end user.

1.4 Target group and qualification

The product and this documentation are directed towards technically trained specialists staff such as:

- Development engineers
- Plant engineers
- Installers/service personnel
- Application engineers

Only specialists may install, program and commission the product. Specialist staff are persons who

- have appropriate training and experience in working with motors and their control,
- are familiar with and understand the content of this technical manual,
- know the applicable regulations.

1.5 Warranty and disclaimer

Nanotec assumes no liability for damages and malfunctions resulting from installation errors, failure to observe this manual or improper repairs. The selection and use of Nanotec products is the responsibility of the plant engineer or end user. Nanotec accepts no responsibility for the integration of the product in the end system.

Our general terms and conditions apply: en.nanotec.com/service/general-terms-and-conditions/.

Customers of Nanotec Electronic US Inc. please refer to <u>us.nanotec.com/service/general-terms-andconditions/</u>.

Note

Changes or modifications to the product are not permitted.

1.6 Other applicable regulations

In addition to this technical manual, the following regulations are to be observed:

- Accident-prevention regulations
- Local regulations on occupational safety

1.7 EU directives for product safety

The following EU directives were observed:

- RoHS directive (2011/65/EU, 2015/863/EU)
- EMC directive (2014/30/EU)

1.8 Used icons

All notices are in the same format. The degree of the hazard is divided into the following classes.

The CAUTION notice indicates a possibly dangerous situation. Failure to observe the notice may result in moderately severe injuries.

Describes how you can avoid the dangerous situation.

Note

Tip

CAUTION

Indicates a possible incorrect operation of the product.

Failure to observe the notice may result in damage to this or other products.

Describes how you can avoid the incorrect operation.

Shows a tip for the application or task.

1.9 Emphasis in the text

The following conventions are used in the document:

Underlined text indicates cross references and hyperlinks:

- The following bits in object <u>6041_h</u> (statusword) have a special function:
- A list of available system calls can be found in chapter <u>NanoJ functions in the NanoJ program</u>.

Text set in *italics* marks named objects:

- Read the *installation manual*.
- Use the *Plug* & *Drive Studio* software to perform the auto setup.
- For software: You can find the corresponding information in the *Operation* tab.
- For hardware: Use the ON/OFF switch to switch the device on.

A text set in Courier marks a code section or programming command:

- The line with the od write (0x6040, 0x00, 5); command has no effect.
- The NMT message is structured as follows: 000 | 81 2A

A text in "quotation marks" marks user input:

- Start the NanoJ program by writing object 2300_h, bit 0 = "1".
- If a holding torque is already needed in this state, the value "1" must be written in 3212_h:01_h.

1.10 Numerical values

Numerical values are generally specified in decimal notation. The use of hexadecimal notation is indicated by a subscript *h* at the end of the number.

The objects in the object dictionary are written with index and subindex as follows: <Index>:<Subindex>

Both the index as well as the subindex are specified in hexadecimal notation. If no subindex is listed, the subindex is $00_{\rm h}$.

Example: Subindex 5 of object 1003_h is addressed with $1003_h: 05_h$, subindex 00 of object 6040_h with 6040_h .

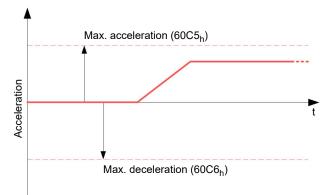

1.11 Bits

The numbering of individual bits in an object always begins with the LSB (bit number 0). See the following figure, which uses data type *UNSIGNED8* as an example.

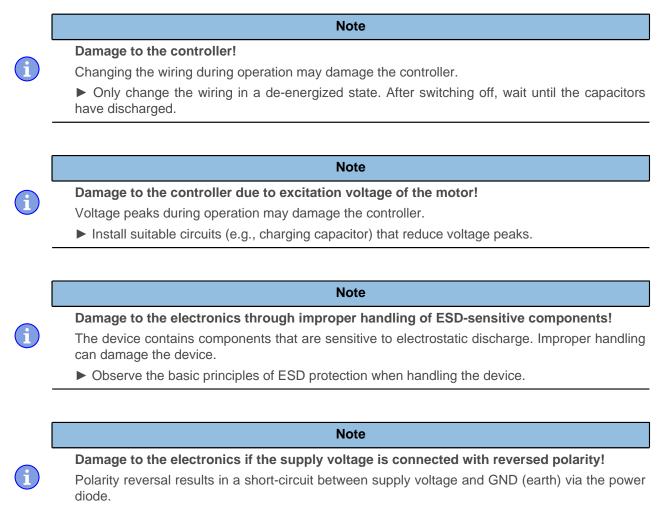

1.12 Counting direction (arrows)

In figures, the counting direction is always in the direction of an arrow. Objects $60C5_h$ and $60C6_h$ depicted as examples in the following figure are both specified as positive.

2 Safety and warning notices

▶ Install a line protection device (fuse) in the supply line.

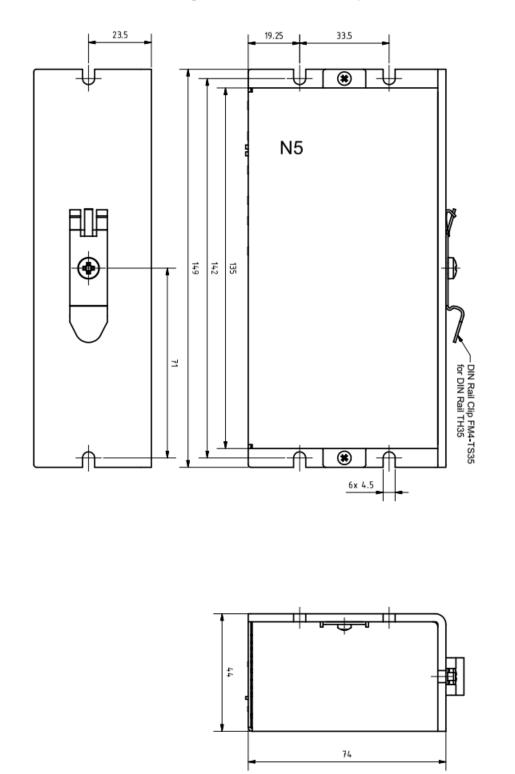

3 Technical details and pin assignment

3.1 Environmental conditions

Environmental condition	Value
Protection class	IP20
Ambient temperature (operation)	-10 +40°C
Air humidity (non-condensing)	0 95 %
Max. Altitude of site above sea level (without drop in performance)	1500 m
Ambient temperature (storage)	-25 +85°C

3.2 Dimensioned drawings and installation options

You can secure the controller by its side tabs to a flat mounting surface using screws or mount it on a TH35 DIN rail in your switch cabinet using the supplied DIN rail clip.

3.3 Electrical properties and technical data

Operating voltage	 12 V -5% 72 V +4% DC for <i>low-current version</i> with designation N5-1-3 12 V - 48 V DC ±5% DC for the <i>high-current version</i> with designation N5-2-3 and up to <u>hardware version</u> w007 12 V -5% 57.4 V DC for the <i>high-current version</i> with designation N5-2-3 and from <u>hardware version</u> w007b
Continuous current (rms)	10 A (low-current version), or 18 A (high-current version)
Peak current (rms)	10 A (low-current version), or 40 A for 5 seconds (high-current version)
Commutation	Stepper motor open loop, stepper motor closed loop with encoder, BLDC sine commutated via Hall sensor, BLDC sine commutated via encoder
Operating mode	 Profile Position Velocity Profile Velocity Profile Torque Homing Clock-direction mode
Fieldbus interfaces	EtherNet/IP™
Encoder input	5 V or 24 V signal, differential or single-ended (switchable by means of software, factory settings: single-ended), max. resolution 65536 increments per revolution (16-bit), UVW connection for Hall sensor
Inputs	 4 inputs, 5 V/24 V (inputs 1 to 4) individually switchable by means of software, factory setting: 5 V 2 inputs (wide range) 5-24 V (inputs 5 and 6); 2 analog inputs -10 to +10 V (factory settings) or 0–20 mA (switchable by means of software)
Outputs	2 transistor outputs (open drain, 0 switching, max. 24 V / 0.5 A)
Brake	1 open drain output, max. 1.5 A
Overvoltage and undervoltage	Protection circuit for voltage > 77.5 V or < 9 V (low-current version)
	Protection circuit for voltage > 52.4 V or < 9 V (high-current version)
Overtemperature	Protection circuit at temperature > 70°C
Polarity reversal protection	Overvoltage and undervoltage protection
protection	Overtemperature protection (> 75° Celsius on the power board)
	Polarity reversal protection: In the event of a polarity reversal, a short- circuit will occur between supply voltage and GND over a power diode; a line protection device (fuse) is therefore necessary in the supply line. The values of the fuse are dependent on the application and must be dimensioned
	greater than the maximum current consumption of the controller,less than the maximum current of the voltage supply.
	If the fuse value is very close to the maximum current consumption of the controller, a medium / slow tripping characteristics should be used.

3.4 Overtemperature protection

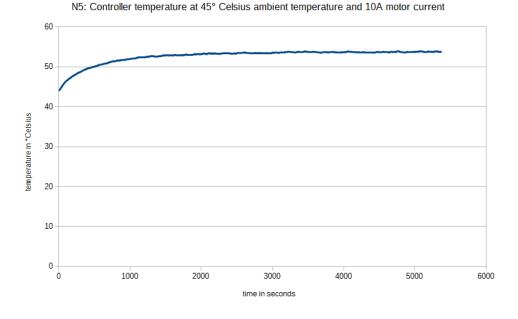

Above a temperature of approx. 75°C on the power board (corresponds to 65–72°C outside on the back cover), the power part of the controller switches off and the error bit is set (see objects 1001_h and 1003_h). After cooling down and confirming the error (see <u>table for the controlword</u>, "Fault reset"), the controller again functions normally.

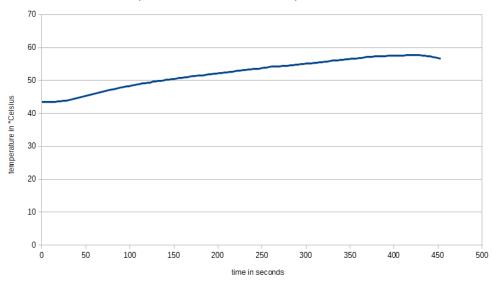

The following temperature test results provide information on the temperature behavior of this controller.

Temperature tests are performed under the following conditions:

- Operating voltage: 48 V DC
- Motor current: 10 A (N5-1-x low current)/18 A (N5-2-x high current) rms
- Operation mode: Velocity Mode, full step, 30 rpm
- Ambient temperature: 45 °C
- Altitude of site: 500 m above sea level
- No external cooling in the climatic chamber, e. g., via fan

The following graphics show the results of the temperature tests:

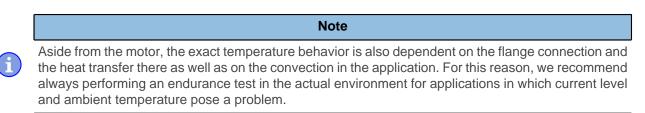

At 45°C (48 V, 10 A rms, Velocity Mode 30 rpm), the N5-1-x was in operation for longer than 1 hour without having been switched off. The temperature was stable at approx. 53°C.

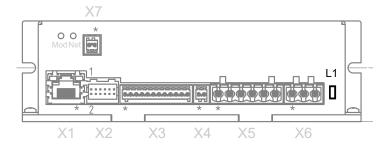

At 45°C (+48 V, 18 A rms, Velocity Mode 30 rpm), temperature protection switched off the N5-2-x in less than 8 minutes.

3.5 LED signaling

3.5.1 Power LED

The power LED indicates the current status.

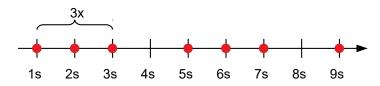

3.5.1.1 Normal operation

In normal operation, the green power LED L1 flashes briefly once per second.

3.5.1.2 Case of an error

If an error has occurred, the LED turns red and signals an error number. In the following figure, the error number 3 is signaled.

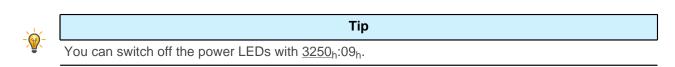

The following table shows the meaning of the error numbers.

Flash rate	Error
1	General
2	Voltage
3	Temperature
4	Overcurrent
5	Controller
6	Watchdog-Reset

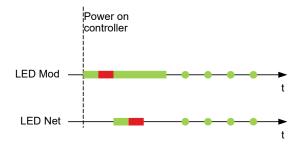

3.5.2 EtherNet/IP[™] LEDs

The "Mod" and "Net" LEDs flash in the pattern depicted below after switching on the controller.

After the start-up sequence, the "Mod" and "Net" LEDs flash continuously until an EtherNet/IP[™] connection is established. All other flash combinations are described in the following chapters.

3.5.2.1 Mod LED

The Mod LED indicates the one of the following states of the controller:

LED behavior	Summary	Prerequisite
Permanently off	No voltage supply	If the controller has no voltage supply, the Mod LED is permanently off.
Continuously green	Device ready for operation	If the controller is operating correctly, the LED is continuously green.
Flashing green	Standby	If the controller is not configured, the Mod LED flashes green.
Flashing red	Error (minor fault)	If an error occurs, the Mod LED flashes red.
Continuously red	Watchdog (major fault)	If a watchdog error occurs, the Mod LED illuminates continuously red.

3.5.2.2 Net LED

The Net LED indicates the following status of the controller:

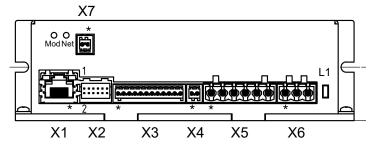

LED behavior	Summary	Prerequisite
Permanently off	No voltage supply, no IP address	The controller is switched off or has voltage supply but no IP address has been configured (interface configuration attribute of the TCP/IP interface object).
Flashing green	No connection	An IP address is configured but no CIP [™] connection was established and an exclusive use connection timed out.

LED behavior	Summary	Prerequisite
Continuously green	Connected	At least one CIP [™] connection (any transport class) is established and an exclusive user connection did not time out.
Flashing red	Connection timeout	An exclusive user connection whose target is the controller is running in a time out. The "Net LED" only switches back to continuously green if all exclusive user connections have been re- established.

3.6 Pin assignment

3.6.1 Overview

Connection	Function
X1	EtherNet/IP [™]
X2	Encoder and Hall sensor connection
Х3	Digital/analog inputs and outputs
X4	Brake connection
X5	Motor connection
X6	Voltage supply
Х7	External logic supply, input voltage +24 V DC
	Voltage supply for encoder, input voltage +24 V DC

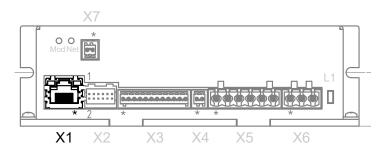

Note

All pins with designation *GND* are internally connected.

3.6.2 X1 – EtherNet/IP[™]

Type: RJ45 socket

Pin 1 is marked with an asterisk "*".

i

1

Note

The most frequently used network topology is the star topology. All nodes are connected to a central node (e.g. via an Ethernet switch) by means of a point-to-point connection.

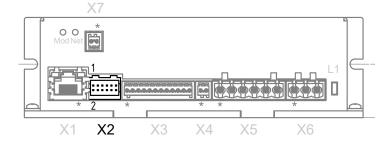

3.6.3 X2 - encoder/Hall sensor

Note

Two types of encoder/Hall sensor are supported:

- Encoder/Hall sensor with 5 V supply voltage. In this case, nothing is to be connected to X7; object <u>2059</u>_h must be set to the value "0" (factory setting).
- Encoder/Hall sensor with 24 V supply voltage. In this case, you must connect a voltage of 24 V DC to X7 (see <u>X7 – voltage supply for encoder/Hall sensor, external logic supply</u>) and set bit 0 in <u>2059</u>_h to "1".
- Type: JST S12B-PADSS-1
- Mating connector (not included in scope of delivery):
 - Housing: JST PADP-12V-1-S (or equivalent)
 - Socket contacts: JST SPH-001T-P0.5L (or equivalent)
- Suitable Nanotec cables (not included in the scope of delivery):
 - □ ZK-PADP-12-500-S
 - □ ZK-M12-8-2M-2-PADP
 - □ ZK-M12-12-2M-2-PADP
 - ZK-NTO3-10-500-PADP / ZK-NTO3-10-1000-PADP
 - □ ZK-NOE-10-500-S-PADP
 - □ ZK-WEDL-500-S-PADP

Pin 1 and pin 2 are marked in the figure.

Pin	Function	Note
1	GND	
2	Vcc	+5 V DC (factory setting) or +24 V DC, output voltage switchable by means of software with object <u>2059_h.</u>
3	A	5/24 V signal, max. 1 MHz
4	В	5/24 V signal, max. 1 MHz
5	A\	5/24 V signal, max. 1 MHz
6	B/	5/24 V signal, max. 1 MHz
7	I	5/24 V signal
8	I	5/24 V signal
9	Hall 1	5/24 V signal
10	Hall 2	5/24 V signal
11	Hall 3	5/24 V signal
12	Shielding	Shielding

Note

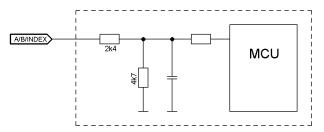

If a single-ended encoder is used, channels A/, B/ and I/ are not evaluated!

- To ensure that a single-ended encoder is correctly detected:
- ▶ Set bit 1 in the object <u>2059</u>_h to "1".
- ▶ Do not connect anything to pins A\, B\, I\, and do not connect these pins to ground (GND).

It must be ensured that the encoder reaches the switching thresholds specified below. Otherwise, an additional external circuit is necessary.

Туре	Switching thresholds			
		On		Off
Single-ended 5 V	> 3.8 V		< 0.26 V	
Differential 5 V	> 3.8 V		< 0.26 V	
Single-ended 24 V	> 14.42 V		< 4.16 V	
Differential 24 V	> 14.42 V		< 4.16 V	

The internal wiring of the encoder inputs is shown in the following.

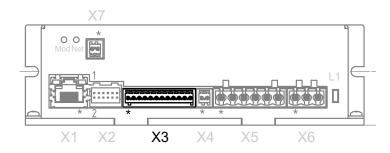

3.6.4 X3 – inputs and outputs

- Type: Phoenix Contact MC 0.5/12-G-2.5
- Mating connector (included in scope of delivery): Phoenix Contact FK-MCP 0.5/12-ST-2.5 (or equivalent)
- Nanotec article number: ZCPHOFK-MC0,5-12

Pin 1 is marked with an asterisk "*".

3 Technical details and pin assignment

	Pin Function	Note
1	GND	
2	Input 1	5 V / 24 V digital input, switchable by means of software with object $\underline{3240}_h$
3	Input 2	5 V / 24 V digital input, switchable by means of software with object $\underline{3240}$
4	Input 3	5 V / 24 V digital input, switchable by means of software with object <u>3240</u> , max. 1 MHz, direction input in clock-direction mode
5	Input 4	5 V / 24 V digital input, switchable by means of software with object <u>3240</u> , max. 1 MHz, clock input in clock-direction mode
6	Input 5	Digital input 5 V to 24 V, not switchable by means of software
7	Input 6	Digital input 5 V to 24 V, not switchable by means of software
8	Analog input 1	-10 V+10 V or 020 mA, switchable by means of software with object $\underline{3221}_h$
9	Analog input 2	-10 V+10 V or 020 mA, switchable by means of software with object $\underline{3221}_h$
10	Output 1	Digital output, open drain, max. 24 V / 0.5 A
11	Output 2	Digital output, open drain, max. 24 V / 0.5 A
12	Shielding	Shielding

The following switching thresholds apply for inputs 1 to 4:

Max. Voltage	Switching thresholds		
	Switching on	Switching off	
5 V	> 3.8 V	< 0.26 V	
24 V	> 14.42 V	< 4.16 V	

The following switching thresholds apply for inputs 5 and 6 (wide-range inputs from 5-24 V):

Switching thresholds			
Switching on Switching off		Switching off	
> 3.25 V		< approx. 2 V

3.6.7 X6 - voltage supply

- Type: Würth Elektronik 691313710003
- Mating connector (included in scope of delivery): Würth Elektronik 691352710003 (or equivalent)
- Nanotec article number: ZCWE-RM5-3

3.6.7.1 Voltage source

The operating or supply voltage supplies a battery, a transformer with rectification and filtering, or a switching power supply.

Note

EMC: For a DC power supply line longer than 30 m or when using the motor on a DC bus, additional interference-suppression and protection measures are necessary.

► An EMI filter is to be inserted in the DC supply line as close as possible to the controller/motor.

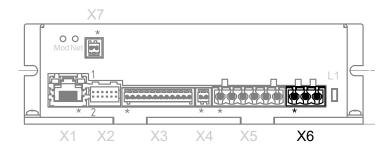

► Long data or supply lines are to be routed through ferrites.

3.6.7.2 Connections

Pin 1 is marked with an asterisk "*".

3 Technical details and pin assignment

	Pin	Function	Note

AWG acc. to UL/CUL	26	12

3.6.7.3 Permissible operating voltage

Depending on the version, the maximum permissible voltage is:

- N5-1 (low current): 75 V DC
- N5-2 (*high current*) and up to <u>hardware version</u> w007: 51.5 V DC
- N5-2 (*high current*) and <u>hardware version</u> w007b and higher: 57.5 V DC. With this version, you must if desired enter the right threshold value in <u>2034h Upper Voltage Warning Level</u>.

If the input voltage of the controller exceeds this threshold value, the motor is switched off and an error triggered. Above the response threshold set in 4021_h :02_h (but at the latest from 57.5 V), the integrated ballast circuit is activated (thick-film resistor PWR163S-25-15R0J from Bourns with 25 W continuous output).

The minimum operating voltage is 11.4 V DC. If the input voltage of the controller falls below 10 V, the motor is switched off and an error triggered.

A charging capacitor of at least 4700 μ F / 50 V (approx. 1000 μ F per ampere rated current) must be connected in parallel to the supply voltage to avoid exceeding the permissible operating voltage (e.g., during braking).

3.6.8 X7 – voltage supply for encoder/Hall sensor, external logic supply

3.6.8.1 Functionality

The voltage supply at X7 must be connected under one of the following conditions:

- A 24 V encoder/Hall sensor is used. In this case, a voltage of 24 V DC must be connected to X7 and bit 0 in object <u>2059_h</u> set to the value "1".
- A logic voltage supply is necessary for the controller to ensure continued access to the following functions should the power supply be lost at connector X6 (see "X6 – voltage supply"):
 - Logical functionality of the controller
 - Controller communication
 - Encoder

i

Note

The windings of the motor are not supplied by the logic supply.

In this case, a voltage of 24 V DC must be connected to X7. With a 24 V encoder, bit 0 in object 2059_h must be set to the value "1". In the case of a 5 V encoder, bit 0 in object 2059_h is to be set to the value "0" (factory setting).

Note

Damages to the encoder/Hall sensor from high voltage!

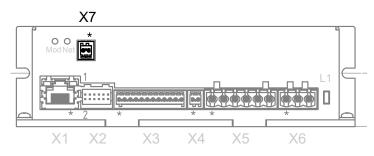

The encoder/Hall sensor can be damaged if object 2059_h is incorrectly configured.

▶ Make certain that bit 0 in object 2059_h is not set before you connect an encoder/Hall sensor with rated voltage less than 24 V.

3.6.8.2 Connection

- Type: Phoenix Contact MC 0.5/2-G-2.5
- Mating connector (included in scope of delivery): Phoenix Contact FK-MCP 0.5/2-ST-2.5 (or equivalent)
- Nanotec article number: ZCPHOFK-MC0,5-2

Pin 1 is marked with an asterisk "*".

	Pin	Function	Note

4 Commissioning

Described in this chapter is how you establish communication with the controller and set the necessary parameters to make the motor ready for operation.

The *Plug & Drive Studio* software offers you an option for performing the configuration and adapting the controller to the connected motor. You can find further information in document *Plug & Drive Studio: Quick Start Guide* at <u>us.nanotec.com</u>.

Observe the following note:

EMC: Current-carrying cables – particularly around supply and motor cables – produce electromagnetic alternating fields. These can interfere with the motor and other devices. Suitable measures may be:

Note

- ▶ Use shielded cables and earth the cable shielding on both ends over a short distance.
- ► Keep power supply and motor cables as short as possible.
- ▶ Use cables with cores in twisted pairs.
- ▶ Earth motor housing with large contact area over a short distance.
- ► Lay supply, motor and control cables separately.

4.1 Configuration via Ethernet

4.1.1 Overview

4.1.1.1 Interface

The controller is equipped with a 10/100 MBit Ethernet interface on connector X1. It can thereby be operated with all common Ethernet components (switches, PCs) and configured via the *Plug & Drive Studio* software.

4.1.1.2 Hardware address

The controller initially has no IP address, but is instead addressed via the printed hardware address (MAC address). This address consists of 6 hexadecimal numbers in form44-AA-E8-xx-xx-xx.

The hardware address is unique and unchangeable and is assigned during production. In general, this is only needed during a firmware update. As soon as the boot loader has ended and the actual firmware begins to operate, subsequent communication takes place via the TCP/IP protocol.

4.1.1.3 IP address

The controller needs a valid IP address. This can be obtained in the following ways:

- DHCP: A DHCP server assigns the IP address to the controller (default setting).
- Static IP address: This is defined by the user.

Which method is used depends on the network environment and is defined by the network administrator.

4.1.2 Establishing connection with the controller

4.1.2.1 Setting the IP address

Each of the connected devices (controller and communication partners) in an Ethernet network or with a point-to-point Ethernet connection requires a unique IP address. This can either be obtained automatically (DHCP) or assigned statically. In the following, "communication partner" refers to a PC or laptop.

You can integrate the controller in an existing Ethernet network. To do this, you only need to establish the physical connection with a standard Ethernet cable. Provided DHCP is activated on the controller (factory

setting), the controller is also automatically detected on the network and can immediately be operated via a PC located on the network.

4.1.2.2 Setting DHCP

IP addresses can be obtained dynamically in a network from a DHCP server. DHCP is preset in the controller at the factory for automatically obtaining an IP address from a DHPC server.

If the DHCP server also assigns a hostname for the IP address to be assigned, this hostname is adopted by the controller. From this point on, the controller responds only to this hostname and no longer to the MAC address.

Note

To establish the connection to the controller, it may only be necessary to make a few settings on the communication partner (e.g., PC or laptop). Settings using the Windows 7 operating system as an example:

- 1. Press the Windows Start button and select Control Panel.
- 2. Select Network and Sharing Center.
- 3. Select Change adapter settings.
- **4.** A list of the available network adapters is displayed. Open the properties on the adapter to which the controller is connected (e.g., click with the right mouse button).
- 5. Select Internet Protocol version 4 (TCP/IPv4) and press the Properties button.
- 6. Select the Obtain an IP address automatically option.
- 7. Confirm acceptance of the entries with the OK button.

tworking Sharing	8	General Alternate Configuration	matically if	vour n	etwork supports

Install Uninstall Properties		Preferred DNS server:	,		
Description		Alternate DNS server:			
Transmission Control Protocol/Internet Protocol. The default wide area network protocol that provides communication across diverse interconnected networks.		Validate settings upon exit			Advanced

4.1.2.3 Setting a static IP address

If static addresses are to be assigned to the controller and the communication partner, just a few settings need to be performed on the controller and the communication partner.

The controller can be assigned a static IP address and network mask (each IPv4) through OD entries. The following entries are relevant in the object dictionary:

Index	Description
<u>2010_h</u>	IP configuration, bit mask with the following meaning:
	Bit 0: A static IP address from object 2011_h and the network mask from object 2012_h are used.
<u>2011_h</u>	Static IP address, 4 bytes in hex coding
<u>2012_h</u>	Static IP subnet mask, 4 bytes in hex coding
<u>2013_h</u>	Gateway address
<u>2014_h</u>	Active IP address, 4 bytes in hex coding
<u>2015_h</u>	Active IP subnet mask, 4 bytes in hex coding
<u>2016_h</u>	Currently used gateway address
<u>200F_h</u>	MAC address

Note

You must save the objects $2010_h...2013_h$ (*category: Ethernet*) after making changes (see the chapter <u>Saving objects</u>) by writing the value "65766173" in $1010_h:0C_h$. The changes are not taken over until after the controller has been restarted.

Notes:

- If DHCP was activated, the controller uses the set static IP address if no address could be assigned via DHCP (e.g., because the DHCP service is temporarily unavailable).
- If both objects <u>2010_h</u> and <u>2011_h</u> are set to the value "0", an incorrect configuration is assumed and DHCP are switched on.
- If bit 0 is set in object <u>2010</u>_h, the static IP address is used. DHCP is not used in this case.
- If only DHCP is switched on and an IP address assignment did not function, an attempt is made independent of bit 0 to connect using the entered static IP address.

A static IP address is also assigned to the communication partner. Settings using the Windows 7 operating system as an example:

- 1. Press the Windows Start button and select Control Panel.
- 2. Select Network and Sharing Center.
- 3. Select Change adapter settings.
- **4.** A list of the available network adapters is displayed. Open the properties on the adapter with which the controller is connected (e.g., right-mouse click and select *Properties*).
- 5. Select Internet Protocol version 4 (TCP/IPv4) and press the Properties button.
- 6. Select the Use the following IP address: option and enter the desired IP address and network mask in the IP address field.
- 7. Confirm acceptance of the entries with the OK button.

4.1.2.4 Establishing network connection

Establish a physical connection between controller and communication partner using a standard Ethernet cable. If static IP addresses were assigned to the controller and the communication partner, they can communicate directly.

If you have your own DHCP server and wish to ascertain the IP address, this can be accomplished most easily with the *ping* tool. To do this, the NetBIOS service must be activated on the PC and the MAC address of the controller must be known.

Example

If controller with MAC address 44:AA:E8:00:02:9F is to be addressed, the tool is called in a shell or command line using:

ping MAC-44AAE800029F

4.1.3 REST web services

4.1.3.1 Introduction

The protocol used by the web server is HTTP/1.0. The architecture here is realized according to REST (Representational State Transfer) which also offers the possibility to access objects/resources. The values in the object dictionary are an example of this.

The operations supported here are:

- GET: Request a resource
- POST: Add a new resource

4.1.3.2 Resource names

The name of a resource is always specified in the *URI (Uniform Resource Identifier)* notation familiar from the Internet. Via this *URI*, the controller supports access to the <u>object dictionary</u>. The identifier for this is:

Od: Object dictionary

Example

Accessing a value in the object dictionary:

```
GET /od/6040/00 HTTP/1.0
```

This string is used to access entry 6040_h subindex 00_h in the object dictionary.

The reply is made as a JSON string and reflects the content of this object:

```
HTTP/1.0 200 OK
Server: uip/1.0
Cache-Control: no-cache, no-store, private
Content-type: application/json
"0006"
```

Writing a value to the object dictionary:

```
POST /od/6040/00 HTTP/1.0
Content-Type: application/x-www-form-urlencoded
Form item: ""000F"" = ""(Key: "000F", Value:)
This string is used to write value "15(0F<sub>h</sub>)" to object <u>6040<sub>h</sub></u> subindex 00<sub>h</sub>.
The controller receives confirmation with status code 200 OK:
HTTP/1.0 200 OK
Server: uip/1.0
```

4.1.3.3 Accessing the object dictionary

The following URIs enable access to the object dictionary:

<IP address>/od/xxxx/yy

Requests entry xxxx subindex yy from the object dictionary.

<IP address>/od/xxxx/data

Requests entry xxxx with all subindices.

Example

Accessing a value in the object dictionary:

http://192.168.2.100/od/6040/00

This string is used to access entry $\underline{6040}_h$ subindex 00_h in the object dictionary.

The reply is made as a JSON string and reflects the content of this object.

4.2 Commissioning EtherNet/IP[™]

This controller is equipped with an EtherNet/IP[™] interface. Read chapter EtherNet/IPfor further details.

i

Note

Nanotec controllers are always based on CANopen standard CiA402. All attributes are therefore stored in a so-called *object dictionary*. These can be addressed with an index and a subindex, e.g., 1018_{h} :01_h. The index is a 16-bit value and the subindex is an 8-bit value.

The controller offers EtherNet/IP[™], but this protocol uses a different procedure: all attributes are stored on the basis of objects. For this reason, the *N5* uses an assignment to create a bridge between EtherNet/IP[™] and CANopen. As a consequence, the configuration of this controller is somewhat different that with normal EtherNet/IP[™] devices.

The following commissioning procedure assumes the use of a *CompactLogix* PLC and *Studio 5000* software from Rockwell.

4.2.1 Connection

- 1. Connect the supply voltage to connector X6 (see chapter X6 voltage supply).
- 2. Connect the Rockwell *CompactLogix* PLC to connection X1 of the controller (see chapter <u>X1 EtherNet/</u><u>IP</u>).

4.2.2 Software connection

By default, the controller is in DHCP mode. A DHCP server is therefore needed in the network. If no DHCP server is available or if the controller is to operate with a fixed IP address, the *BOOTP/DHCP* tool from Rockwell can be used. With this tool, is is possible to either assign an IP address to the controller by means of DHCP or to assign a static address and deactivate DHCP. BOOTP is not supported by the controller.

If you have your own DHCP server and wish to ascertain the IP address, this can be accomplished most easily with the *ping* tool. To do this, the NetBIOS service must be activated on the PC and the MAC address of the controller must be known.

Example

If controller with MAC address 44:AA:E8:00:02:9F is to be addressed, the tool is called in a shell or command line using:

ping MAC-44AAE800029F

You must perform the next steps in the Rockwell Logix Designer.

- 1. Use the *RSLinx Classic* software to create an EtherNet/IP[™] driver. Refer to the corresponding manual for help.
- **2.** Select the project path of the PLC.

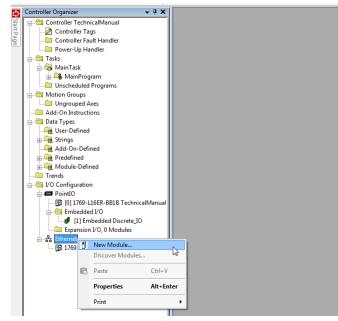

Controller	Path		Go Online
PLC	AB ETHIP-1\192.168.60.100		de entito
ACSEIP	AB_DF1-1		Upload
LogixTester	AB_DF1-1\1		Download
			Close
			Help
Show Only F	Paths Matching Serial Number in Project	Reset Path List	Set Project Path
Serial Number i	n Project: <none></none>		Clear Project Path
Path in Project:	<none></none>		Cicar Hoject Hati

3. Import the EDS file of the controller: Click on *Tools**EDS Hardware Installation Tool*, select *Register an EDS file(s)*. Then select the correct EDS file and import it.

4. Right-click on Ethernet in the Controller Organizer and select New Module....

Select the Catalog tab, find entry N5 and select the device with which you would like to work.

It Module Type Module Discovery Favo	vrites	ilters	Hide Filters 🛠

4.3 Setting the motor data

Prior to commissioning, the motor controller requires a number of values from the motor data sheet.

- Number of pole pairs: Object 2030_h:00_h (pole pair count) The number of motor pole pairs is to be entered here. With a stepper motor, the number of pole pairs is calculated using the step angle, e.g., 1.8° = 50 pole pairs, 0.9° = 100 pole pairs (see step angle in motor data sheet). With BLDC motors, the number of pole pairs is specified directly in the motor data sheet.
- Object <u>2031_h</u>:00_h: maximum permissible motor current (motor protection) in mA (see motor data sheet)
- Object 6075_h:00_h: rated current of the motor in mA (see motor data sheet), limited by 2031_h
- Object <u>6073</u>_h:00_h: maximum current (for a stepper motor, generally corresponds to the rated current, bipolar) in tenths of a percent of the set rated current (see motor data sheet). Factory settings: "1000", which corresponds to 100% of the value in <u>6075_h</u>. Is limited by <u>2031_h</u>.
- Object <u>203B_h</u>:02_h Maximum duration of the maximum current (<u>6073_h</u>) in ms (for initial commissioning, Nanotec recommends a value of 100 ms; this value is to be adapted later to the specific application).
- Setting the motor type:
 - □ Stepper motor:
 - Object <u>3202_h</u>:00_h (Motor Drive Submode Select): Defines motor type stepper motor, activates current reduction on motor standstill: 0000008h.See also chapter <u>Commissioning open loop</u>.
 - BLDC motor:
 - Object <u>3202_h:00_h</u> (Motor Drive Submode Select): Defines motor type BLDC: 00000040h
- Motor with encoder: Object <u>2059_h</u>:00_h (Encoder Configuration): Depending on the encoder version, one of the following values is to be entered (see motor data sheet):
 - □ Supply voltage 5V, differential: 0000000h
 - □ Supply voltage 24V, differential: 0000001h
 - □ Supply voltage 5V, single-ended: 0000002h
 - □ Supply voltage 24V, single-ended: 0000003h
- Motor with encoder without index: You must set the encoder parameters after the <u>Auto setup</u>, see chapter <u>Configuring the sensors</u>.
- Motor with brake: Object <u>3202</u>_h:00_h (Motor Drive Submode Select): The brake control is activated for the initial commissioning. Depending on the specific application, this configuration can be deactivated later if necessary. One of the following values is to be entered depending on the motor type:
 - □ Stepper motor, brake control (and current reduction) activated: 0000000Ch
 - □ BLDC motor, brake control activated: 00000044h

Note

Due to the sine commutation and the sinusoidal current flow, the current of a motor winding can achieve an alternating current value that is briefly greater (by max. $\sqrt{2}$ times) than the set current.

At especially slow speeds or while at a standstill with full load, one of the windings can therefore be supplied with overcurrent for a longer period of time. Take this into account when dimensioning the motor and select a motor with larger torque reserve if necessary if required by the application.

4.4 Connecting the motor

After setting the motor parameters, see <u>Setting the motor data</u>, connect the motor and, if applicable, the present sensors (encoders / Hall sensors) and the brake.

i

Note

Damage to the electronics if motor is connected incorrectly!
Observe the PIN assignment in chapter *Pin assignment* and the motor data sheet.

- Connect the motor:
 - □ to connection X5, see <u>X5 motor connection</u>
- Connect encoders / Hall sensors:
 - □ to connection X2, see <u>X2 encoder/Hall sensor</u>
- Connect the brake:
 - □ to connection X4, see X4 brake connection

How the automatic brake control can be activated is described in chapter Automatic brake control.

4.5 Auto setup

To determine a number of parameters related to the motor and the connected sensors (encoders/Hall sensors), you must perform an auto setup.

Tip

As long as the motor connected to the controller or the sensors for feedback (encoders/Hall sensors) are not changed, auto setup is only to be performed once during initial commissioning.

Note

Note the following prerequisites for performing the auto setup:

- ► The motor must be load-free.
- ► The motor must not be touched.
- ► The motor must be able to turn freely in any direction.
- ▶ No NanoJ programs may be running (object 2300_h:00_h bit 0 = "0", see <u>2300h NanoJ Control</u>).

Tip

Execution of the auto setup requires a relatively large amount of processor computing power. During the auto setup, this may result in fieldbuses not being operated in a timely manner.

4.5.1 Parameter determination

Auto setup determines various parameters of the connected motor and of the present sensors by means of multiple test runs and measurement runs. To a certain extent, the type and number of parameters are dependent on the respective motor configuration.

Parameter	All motors independent of the configuration
Motor type (stepper motor or BLDC motor)	\checkmark
Winding resistance	\checkmark
Winding inductance	\checkmark
Interlinking flux	\checkmark

Parameter	Motor without encoder	Motor with encoder and index	Motor with encoder without index
Encoder resolution	-	\checkmark	
Alignment (shifting of the electrical zero to the index)	-	\checkmark	

Parameter	Motor without Hall sensor	Motor with Hall sensor
Hall transitions	-	\checkmark

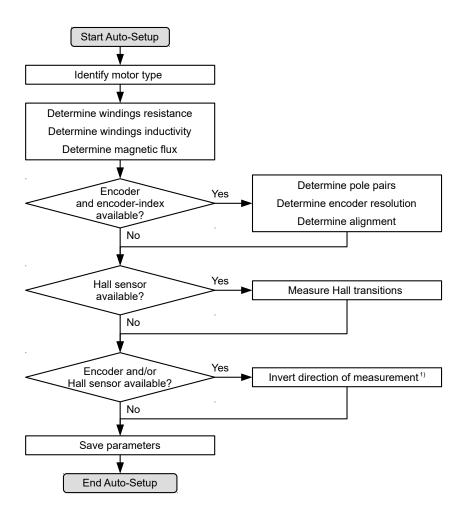

4.5.2 Execution

Before performing the *auto setup*, make certain that you have correctly set the necessary parameters (see <u>Setting the motor data</u>).

- To preselect the *auto setup* operating mode, enter the value "-2" (="FE_h") in object 6060_h:00_h. The *power state machine* must now switch to the *Operation enabled* state, see <u>CiA 402 Power State</u> <u>Machine</u>.
- 2. Start *auto setup* by setting bit 4 *OMS* in object 6040_h:00_h (controlword).

While the auto setup is running, the following tests and measurements are performed in succession:

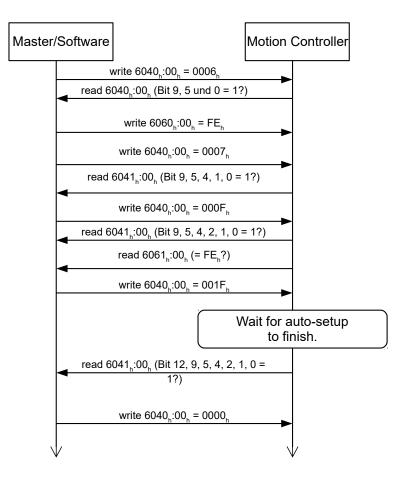

1) To determine the values, the direction of the measurement method is reversed and edge detection re-evaluated.

Value 1 in bit 12 *OMS* in object $6041_h:00_h$ (statusword) indicates that the auto setup was completely executed and ended. In addition, bit 10 *TARG* in object $6041_h:00_h$ can be used to query whether (= "1") or not (= "0") an encoder index was found.

4.5.3 Parameter memory

After a successful *auto setup*, the determined parameter values are automatically taken over into the corresponding objects and stored with the storage mechanism, see <u>Saving objects</u> and <u>1010h Store</u> <u>Parameters</u>. Categories *Drive* 1010_h:05_h and *Tuning* 1010_h:06_h are used.

Uncontrolled motor movements!

After the auto setup, the internal coordinate system is no longer valid. Unforeseen reactions can result.

▶ Restart the device after an auto setup. Homing alone does not suffice.

4.6 Configuring the sensors

The parameters (configuration, alignment, etc.) of each feedback are determined by <u>Auto setup</u> and stored in the following objects:

Object	Feedback	Description
<u>3380_h</u>	Sensorless	Contains measurement and configuration values for sensorless control
<u>3390_h</u>	Hall sensor (digital)	contains configuration values for the Hall sensors
<u>33A0_h</u>	Incremental encoder 1	contains configuration values for the first incremental encoder

i

It is not possible to determine the resolution of encoders without index or with more than one index per motor revolution.

In this case, you must enter and store the parameters in the corresponding objects (see $\underline{3204}_h$, $\underline{60E6}_h$ and $\underline{60EB}_h$) (category *Tuning*, see <u>Saving objects</u>).

For external sensors that are not mounted directly on the motor shaft, you must set and store the gear ratio according to the constructive features (objects $\underline{60E8}_h$ and $\underline{60ED}_h$) and/or the feed constant (objects $\underline{60E9}_h$ and $\underline{60EE}_h$) (category *Application*).

Example

An encoder with a resolution of 2000 increments/mm was connected that is to be used in the field directly at the process for a high-precision position measurement. The constructive design was realized as follows:

Motor	Gearbox	Process	Encoder
Rotary	Rotary Rotary	Rotary Translational	Translational
1	i=4	Diameter 40 mm 125.6637 mm/ revolution	2000 incr./mm (62831.85 incr. per motor revolution)

You must set the resolution, gear ratio and feed constant as follows:

Object	Value
60E6h Additional Position Encoder Resolution - Encoder Increments	1256637
60EBh Additional Position Encoder Resolution - Motor Revolutions	20
60E8h Additional Gear Ratio - Motor Shaft Revolutions	4
60EDh Additional Gear Ratio - Driving Shaft Revolutions	1
60E9h Additional Feed Constant - Feed	2513274 incr. (corresponds to 1256.637 mm)
60EEh Additional Feed Constant - Driving Shaft Revolutions	10

You must still set the unit for the position to millimeters or other unit of length, see chapter <u>User-defined units</u>.

In object 3203_h you can set which of the present feedbacks the controller takes into account for each controller (current controller/commutation, velocity controller, position controller) in *closed loop* or the determination of the actual position and actual speed in *open loop*. See also chapter <u>Closed Loop</u> and <u>Assignment of the feedbacks to the control loops</u>.

5 General concepts

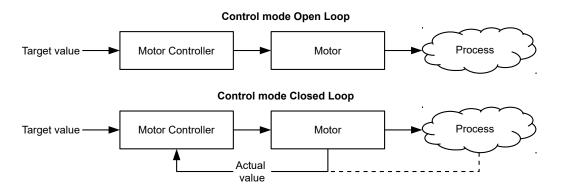

5.1 Control modes

5.1.1 General

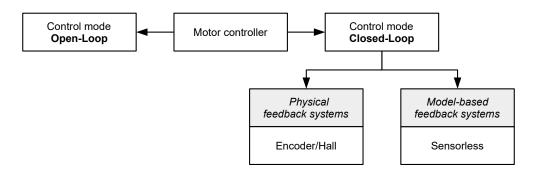

The control mode of systems without feedback is called *open loop*, the mode with feedback is called *closed loop*. In the *closed loop* control mode, it is initially irrelevant whether the fed back signals come from the motor itself or from the influenced process.

For controllers with feedback, the measured control variable (actual value) is constantly compared with a set point (set value). In the event of deviations between these values, the controller readjusts according to the specified control parameters.

Pure controllers, on the other hand, have no feedback for the value that is to be regulated. The set point (set value) is only specified.

In addition to the physical feedback systems (e.g., via encoders or Hall sensors), model-based feedback systems, collectively referred to as *sensorless* systems, are also used. Both feedback systems can also be used in combination to further improve the control quality.

Summarized in the following are all possible combinations of control modes and feedback systems with respect to the motor technology. Support of the respective control mode and feedback is controller-specific and is described in chapters *Pin assignment* and <u>Operating modes</u>.

Control mode	Stepper motor	BLDC motor
Open Loop	yes	no
Closed Loop	yes	yes

Feedback	Stepper motor	BLDC motor
Hall	no	yes
Encoder	yes	yes

Feedback	Stepper motor	BLDC motor
Sensorless	yes	yes

Nanotec developed the <u>Slow Speed</u> control mode, which is a combination of *open loop* and *closed loop*, especially for applications in the low speed range. This control mode can be used if an encoder is present as feedback.

Various operating modes can be used depending on the control mode. The following list contains all the types of operation that are possible in the various control modes.

Operating mode	node Control mode			
	Open Loop	Closed Loop	Slow Speed	
Profile Position	yes	yes	yes	
Velocity	yes	yes	yes	
Profile Velocity	yes	yes	yes	
Profile Torque	no ¹⁾	yes	no	
Homing	yes ²⁾	yes	yes	
Interpolated Position Mode	yes ³⁾	yes	yes	
Cyclic Synchronous Position	yes ³⁾	yes	yes	
Cyclic Synchronous Velocity	yes ³⁾	yes	yes	
Cyclic Synchronous Torque	no ¹⁾	yes	no	
Clock-direction	yes	yes	yes	

1) The <u>Profile Torque</u> and <u>Cyclic Synchronous Torque</u> torque operating modes are not possible in the *open loop* control mode due to a lack of feedback.

2) Exception: Homing on block is not possible due to a lack of feedback.

3) Because ramps and speeds in operating modes <u>Cyclic Synchronous Position</u> and <u>Cyclic Synchronous</u> <u>Velocity</u> follow from the specified points of the master, it is not normally possible to preselect these parameters and to ascertain whether a step loss can be excluded. It is therefore not advisable to use these operating modes in combination with *open loop* control mode.

5.1.2 Open Loop

5.1.2.1 Introduction

Open loop mode is only used with stepper motors and is, by definition, a control mode without feedback. The field rotation in the stator is specified by the controller. The rotor directly follows the magnetic field rotation without step losses as long as no limit parameters, such as the maximum possible torque, are exceeded. Compared to *closed loop*, no complex internal control processes are needed in the controller. As a result, the requirements on the controller hardware and the controller logic are very low. *Open loop* mode is used primarily with price-sensitive applications and simple movement tasks.

Because, unlike *closed loop*, there is no feedback for the current rotor position, no conclusion can be drawn on the counter torque being applied to the output side of the motor shaft. To compensate for any torque fluctuations that arise on the output shaft of the motor, in *open loop* mode, the controller always supplies the maximum possible (e.g., specified by parameters) set current to the stator windings over the entire speed range. The high magnetic field strength thereby produced forces the rotor to assume the new steady state in a very short time. This torque is, however, opposite that of the inertia of the rotor and overall system. Under certain operating conditions, this combination is prone to resonances, comparable to a spring-mass system.

5.1.2.2 Commissioning

To use open loop mode, the following settings are necessary:

- In object <u>2030_h</u> (Pole Pair Count), enter the number of pole pairs (see motor data sheet: for a stepper motor with 2 phases, a step angle of 1.8° corresponds to 50 pole pairs and 0.9° corresponds to 100 pole pairs).
- In object <u>2031_h</u>:00_h, enter the maximum permissible motor current (motor protection) in mA (see motor data sheet)
- In object $6075_h:00_h$, enter the rated current of the motor in mA (see motor data sheet).
- In object <u>6073</u>_h:00_h, enter the maximum current (for a stepper motor, generally corresponds to the rated current, bipolar) in tenths of a percent of the set rated current (see motor data sheet). Factory settings: "1000", which corresponds to 100% of the value in <u>6073</u>_h. A value greater than "1000" is limited internally to "1000".
- In object <u>3202_h</u> (Motor Drive Submode Select), set bit 0 (CL/OL) to the value "0".

Nanotec recommends to activate the current reduction on motor standstill in order to reduce the power loss and heat build-up. To activate current reduction, the following settings are necessary:

- In object <u>3202</u>_h (Motor Drive Submode Select), set bit 3 (CurRed) to "1".
- In object <u>2036</u>_h (open-loop current reduction idle time), the time in milliseconds is specified that the motor must be at a standstill (set value is checked) before current reduction is activated.
- In object <u>2037</u>_h (open-loop current reduction value/factor), the root mean square is specified to which the rated current is to be reduced if current reduction is activated in *open loop* and the motor is at a standstill.

5.1.2.3 Optimizations

Depending on the system, resonances may occur in *open loop* mode; susceptibility to resonances is particularly high at low loads. Practical experience has shown that, depending on the application, various measures are effective for largely reducing resonances:

- Reduce or increase current, see objects <u>6073_h</u> and <u>6075_h</u>, respectively. An excessive torque reserve promotes resonances.
- Reduce or increase the operating voltage, taking into account the product-specific ranges (with sufficient torque reserve). The permissible operating voltage range can be found in the product data sheet.
- Optimize the control parameters of the current controller via objects <u>3210_h</u>:09_h (I_P) and <u>3210_h</u>:0A_h (I_I) or <u>320F_h</u> (generally not necessary).

The current controller operates optimally if the actual current of both windings (square root of the sum $I_a^2 + I_b^2$, $2039_h:03h/:04_h$) divided by 2 at any point in time corresponds to the set rated current ($203B_h:01_h$).

 Adjustments to the acceleration, deceleration and/or target speed depending on the selected control mode:

Profile Position operating mode

Objects <u>6083_h</u> (Profile Acceleration), <u>6084_h</u> (Profile Deceleration) and <u>6081_h</u> (Profile Velocity).

Velocity operating mode

Objects <u>6048</u>_h (Velocity Acceleration), <u>6049</u>_h (Velocity Deceleration) and <u>6042</u>_h (Target Velocity).

Profile Velocity operating mode

Objects <u>6083_h</u> (Profile Acceleration), <u>6084_h</u> (Profile Deceleration) and <u>6081_h</u> (Profile Velocity).

Homing operating mode

Objects $\underline{609A}_h$ (Homing Acceleration), $\underline{6099}_h$:01_h (Speed During Search For Switch) and $\underline{6099}_h$:02_h (Speed During Search For Zero).

Interpolated Position Mode operating mode

The acceleration and deceleration ramps can be influenced with the higher-level controller.

Cyclic Synchronous Position operating mode

The acceleration and deceleration ramps can be influenced via the external "position specification / time unit" targets.

Cyclic Synchronous Velocity operating mode

The acceleration and deceleration ramps can be influenced via the external "position specification / time unit" targets.

Clock-direction operating mode

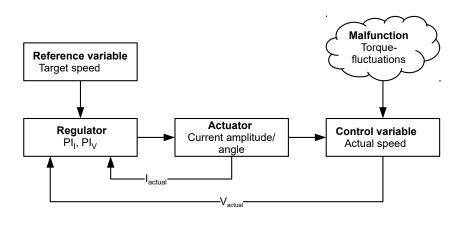

Change of the step resolution via objects 2057_h (Clock Direction Multiplier) and 2058_h (Clock Direction Divider). Optimize acceleration / deceleration ramps by adjusting the pulse frequency to pass through the resonance range as quickly as possible.

5.1.3 Closed Loop

5.1.3.1 Introduction

The *closed loop* theory is based on the idea of a control loop. A disturbance acting on a system should be compensated for quickly and without lasting deviation to adjust the control variable back to the set point.

Closed loop using a speed control as an example:

- PI₁ = Proportional-integral current control loop
- Pl_V = Proportional-integral velocity control loop
- I_{actual}= Actual current
- V_{actuat} Actual speed

The *closed loop* method is also referred to as "sine commutation via an encoder with field-oriented control". At the heart of *closed loop* technology is the performance-adjusted current control as well as the feedback of the actual values of the process. Using sensor signals, the rotor orientation is recorded and sinusoidal phase currents generated in the motor windings. Vector control of the magnetic field ensures that the magnetic field of the stator is always perpendicular to that of the rotor and that the field strength corresponds precisely to the desired torque. The current thereby controlled in the windings provides a uniform motor force and results in an especially smooth-running motor that can be precisely regulated.

The feedback of the control variables necessary for *closed loop* mode can be realized with various technologies. In addition to the physical feedback with encoders or Hall sensors, it is also possible to virtually record the motor parameters through a software-based model calculation. Physical variables, such as speed or back-EMF, can be reconstructed with the help of a so-called "observer" from the data of the current controller. With this sensorless technology, one has a "virtual rotary encoder", which – above a certain minimum speed – supplies the position and speed information with the same precision as a real optical or magnetic encoder.

All controllers from Nanotec that support *closed loop* mode implement a field oriented control with sine commutated current control. Thus, the stepper motors and BLDC motor are controlled in the same way as a servo motor. With *closed loop* mode, step angle errors can be compensated for during travel and load angle errors corrected within one full step.

5.1.3.2 Controller structure

The controller consists of three cascaded PI controllers (proportional-integral): the current controller (commutation), the velocity controller and the position controller.

The current controller is active in all operating modes. The velocity controller is as well with the sole exception of the "Real Torque" modes (torque mode without speed limiting if bit 5 in <u>3202_h</u> is set to "1").

The position controller is active in the following operating modes:

- Profile Position
- Homing
- Interpolated Position Mode
- Cyclic Synchronous Position
- Clock-direction mode
- Velocity/Profile Velocity/Cyclic Synchronous Velocity if bit 1 in <u>3202</u>_h is set to "1"

Note

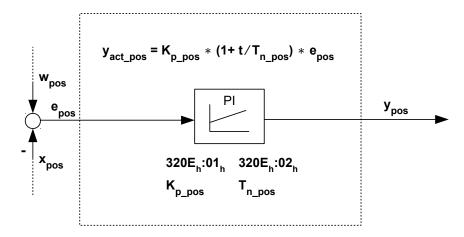

For firmware versions from FIR-v19xx upwards, the new schema described here for the <u>Controller</u> <u>structure</u> applies.

The old control parameters (object 3210_h) are still activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

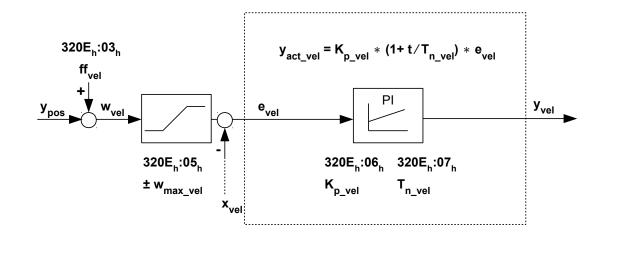

To use the new parameters, you must set 3210_h :07_h (for *closed loop*) or 3210_h :09_h (for *open loop*) to "0". When the controller is switched on, the old values are converted and entered in the new object $320E_h$ or $320F_h$. You must save both objects (see Saving objects).

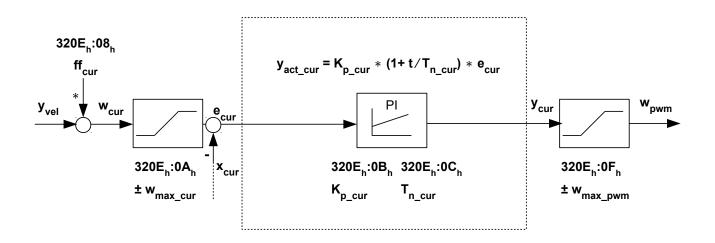

Each controller consists of a proportional component with the *gain factor* K_p and an integral component with the *reset time* T_n . The control variable (the output signal of the controller, which is the set point for the next controller) is limited by the maximum speed (position controller), the maximum current (velocity controller) or the maximum PWM signal (current controller), respectively.

The following figures show the structure of the three cascaded controllers.

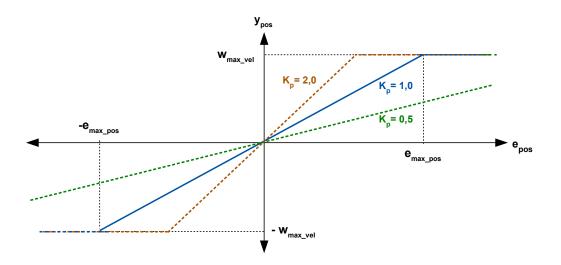

For each controller you can set a maximum control deviation (e_{max}) and a gain factor (K_p) that determine the output of the controller (control variable), taking into account the limitation of the control variable (y_{max}).

The following figure shows the relationship between the maximum control deviation (*e*), the control variable (*y*) and the gain factor (K_p) using the position controller as an example.

With a K_p of 100%, a maximum deviation set in 320E_h:04_h (e_{max_pos}) leads to the set maximum control variable set in 320E_h:05_h (in the case of the maximum speed, y_{max_vel}). For smaller deviations, the control variable is also correspondingly smaller.

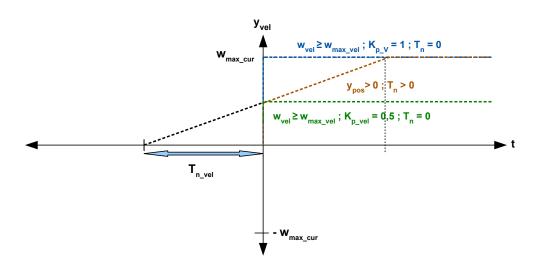

The gain factor K_p has a direct influence on the current control variable: at the same deviation, the control variable is proportional to the gain factor.

Each controller also has an integral component that is determined by the *reset time* (T_n). The following figure shows the influence of the reset time on the control variable using the velocity controller as an example.

The smaller the reset time, the greater the influence of the integral component and the faster the control variable increases. If the reset time is 0, the integral component is internally set to "0" and the controller only has the proportional component.

5.1.3.3 Feed forward

It is also possible to set a *velocity feed forward*, an *acceleration feed forward* (that corresponds to a torque/ current value) and a *voltage feed forward*.

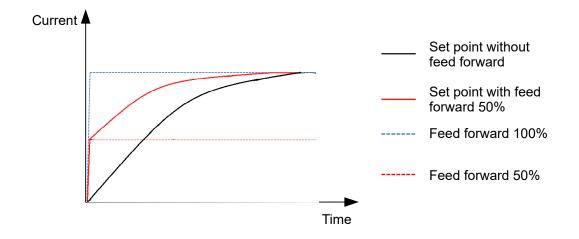

You can use the *feed forward* to add an already known or anticipated control variable to the set point ("predictive"). You can, e. g., compensate for the inertia of the load by adding an acceleration feed forward value to the output of the velocity controller.

The feed forward values are additionally fed to the speed/current control loop or added to the voltage value and are immediately available. A more dynamic control can thereby be achieved.

5 General concepts

The following figure shows the current (produced by the acceleration) during the acceleration phase as a function of the *acceleration feed forward*. At a feed forward value of "50%", the current is at "50%" already at the start of the acceleration phase; the current controller is thereby "relieved".

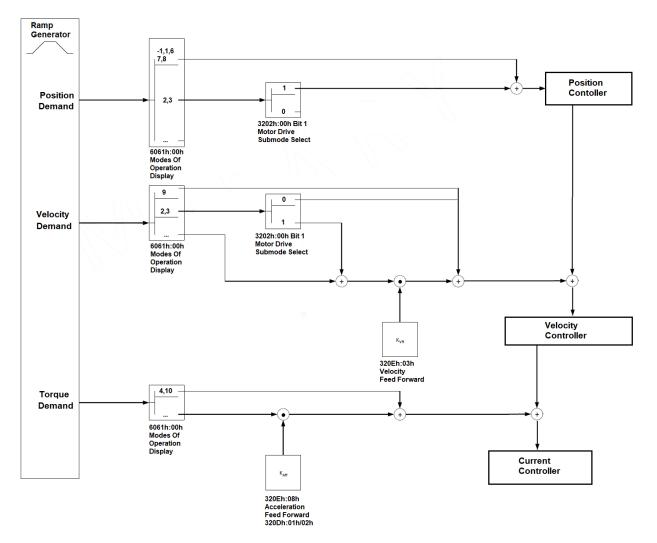

The factor for the *velocity feed forward* is set in object $\underline{320E}_h:03_h$ in tenths of a percent of the output of the ramp generator ($\underline{606B}_h$) and added to the output of the position controller before the velocity controller. The *velocity feed forward* is active in all modes with position control loop:

- Profile Position
- Homing
- Interpolated Position Mode
- Cyclic Synchronous Position
- Clock-direction mode
- Velocity/Profile Velocity if bit 1 in <u>3202</u>_h is set to "1"

The factor for the *acceleration feed forward* is set in object $\underline{320E}_h:08_h$ in tenths of a percent of the factor of $\underline{320D}_h$ and multiplied by the output of the ramp generator ($\underline{6074}_h$). The value is added to the output of the velocity controller before the current controller. The *acceleration feed forward* is active in all modes, with the exception of the torque modes.

The following figure shows the cases in which the feed forward is active and the position of the feed forward within the controller cascade.

The factor for the *voltage feed forward* is specified in object $320E_h:0D_h$ in tenths of a percent of the voltage that is needed to produce the rated current. If the factor is 1000‰ (factory setting), the voltage is immediately available and the actual current quickly reaches the rated current. As a result, there is practically no control deviation during acceleration and the current controller is relieved.

The *voltage feed forward* is active in all modes. To switch it off, set <u>320E_h</u>:0D_h to "0".

5.1.3.4 Assignment of the feedbacks to the control loops

In object 3203_h , you define which of the existing feedbacks the controller takes into account for the individual controllers (current controller/commutation, velocity, position). You can also use a second sensor for the commutation (see <u>Commutation help</u>).

Each subindex of the object contains a bit mask for the respective feedback of a sensor. The bits have the following meaning here:

- Bit 0: If the bit is set to "1", this sensor is used for position feedback.
- Bit 1: If the bit is set to "1", this sensor is used for velocity feedback.
- Bit 2: If the bit is set to "1", this sensor is used for commutation feedback in Closed Loop.

Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter <u>Configuring the sensors</u>.

Which sensor the controller takes into account for the individual controllers (commutation, velocity, position) is implicitly specified by the order of the sensors.

The search always begins with sensor 2 and continues in ascending order until all existing sensors have been queried. If a sensor is found whose feedback is set, it is assigned to the corresponding controller and the search ended.

Example

The controller has two physical interfaces. Hall sensors and a (non-absolute) incremental encoder were connected.

Bit	Controller	Feedback 1 Sensorless	Feedback 2 Hall	Feedback 3 Incremental encoder
0	Position	0	0	1
1	Velocity	0	1	1 ¹
2	Commutation	0	1 ²	1
	Index:Subindex	3203 _h :01 _h	3203 _h :02 _h	3203 _h :03 _h

¹The Hall sensors should be used for velocity control, the encoder for the positioning and commutation. Although the bit for the velocity was also set for the third feedback, this is not taken into account.

²Immediately after switching on – and until the index of the encoder is passed over for the first time – commutation is to take place via the Hall sensors and immediately enable *closed loop* mode.

Commutation help

Some sensors are initially lacking the alignment necessary for the commutation (offset between the index of the encoder and the magnets of the rotor). This means that the rotor orientation cannot be determined using only the position information of the sensor.

For assistance, you can set a second sensor as commutation sensor (bit 2 of the corresponding subindex in 3203_h). It is thereby possible, for example, for each (electric) absolute sensor with alignment (such as a Hall sensor), to offer commutation assistance, e. g., for an incremental encoder without index or still missing alignment (index signal not yet seen since a restart). The controller automatically uses the better sensor for the commutation.

If no second commutation sensor is selected or if the alignment is missing for the selected sensors, an autoalignment is determined in *open loop* if necessary (independent of bit 4 in $3202_{\rm h}$).

5.1.3.5 Commissioning

An auto setup should be performed before using *closed loop* mode. The auto setup operating mode automatically determines the necessary parameters (e.g., motor data, feedback systems) that are necessary for optimum operation of the field oriented control. All information necessary for performing the auto setup can be found in chapter <u>Auto setup</u>.

To use *closed loop* mode, certain settings are necessary depending on the motor type and feedback; see chapter <u>Setting the motor data</u>.

Bit 0 in 3202_h must be set . The bit is set automatically after a successfully completed auto setup.

Activation

If an (electric) absolute sensor (e.g., Hall sensor) is used for the commutation, the *closed loop* is activated automatically already when switching on.

If an encoder is used for the commutation, the index of the encoder must be passed over at least once after switching on before *closed loop* can be activated (remains in *open loop* mode until this takes place).

If no index is present or if it cannot be used, you can:

- use a second sensor for commutation (see <u>Assignment of the feedbacks to the control loops</u>)
- or have an *auto alignment* determined in *open loop* by setting bit 4 in <u>3202_h</u> to "1".
 Auto alignment is determined once every time the controller is restarted after the first command that switches the <u>CiA 402 Power State Machine</u> to the *Operation enabled* state.
 In doing so, the rotor is moved up to a magnetic pole. After the alignment has been determined, the *Operation enabled* state is reached and travel continues if applicable.

í

Note

To be able to determine the *auto alignment*, you must ensure that the (automatic or manual) brake control is deactivated (see chapter <u>Automatic brake control</u>).

CAUTION

Uncontrolled motor movements!

Unforeseeable reactions can result if the alignment is not correctly determined.

- Please observe the following requirements for the use of auto alignment:
- ► The motor shaft must ideally be load-free. If this is not possible, the motor must be designed so that there is a large torque reserve (at least 25%).

▶ Use an encoder with sufficiently high resolution (at least 500 counts per revolution, after quadrature, for a motor with 50 pole pairs)

Bit 15 in <u>6041h Statusword</u> indicates whether or not *closed loop* is active (if the state of <u>CiA 402 Power State</u> <u>Machine</u> is *Operation enabled*).

5.1.3.6 Optimizations

In *closed loop*, the measured control variable (actual value) is constantly compared with a set point (set value). In the event of deviations between these values, the controller readjusts according to the specified control parameters.

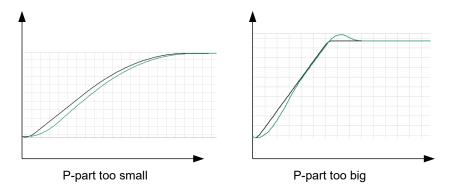

The objective of control parameter optimization (the so-called *tuning* of the controller) is the smoothest possible running of the motor, high accuracy and high dynamics in the reaction of the controller to faults. All control deviations should be eliminated as quickly as possible.

Due to the cascaded <u>Controller structure</u>, it is useful to start the optimization of the inner-most controller (current controller) before the velocity and – if applicable – the position controller are optimized. Each of the three controllers consists of a proportional and an integral component, which should normally be adjusted in this order.

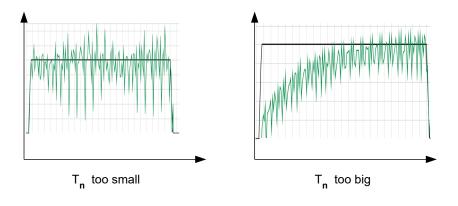

The following figures show the reaction of the controller to a change in set value.

If the proportional component is too small, the actual value remains below the set value. A proportional component that is too large, on the other hand, results in "overshooting".

If the reset time is too small, the system tends toward oscillations. If the reset time is too large, the deviations are compensated for too slowly.

Risk of injury through uncontrolled motor movements!

Incorrect control parameters may result in an unstable control behavior. Unforeseen reactions can result.

► Increase the control parameters slowly and incrementally. Do not increase these further if you notice strong vibrations/oscillations.

► Do not reach for moving parts during operation. After switching off, wait until all movements have ended.

5.1.4 Slow Speed

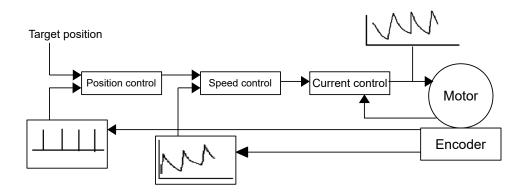

5.1.4.1 Introduction

The *slow speed* mode combines the advantages of *open loop* and *closed loop* technologies in a low speed range and can be used if an encoder is present as feedback. *Slow speed* offers following error monitoring but is more smooth-running than in pure *closed loop* mode at low speeds.

The rotor orientation is detected via the signals of the encoder. To calculate the speed, the change of position is divided by the (fixed) cycle time. At low speeds, the controller counts fewer (or even no) encoder increments in one cycle, which leads to a speed curve with a relatively high number of peaks (in spite of the used low-pass filter).

Due to the cascaded control loop, this results in current peaks in *closed loop* mode, which can lead to uneven running, as the following figure shows.

In the *slow speed* mode, the motor instead operates with constant phase current, as in *open loop*. The following error is, however, monitored by means of the encoder and the vector control of the magnetic field is activated if necessary, as in *closed loop*.

5.1.4.2 Activation

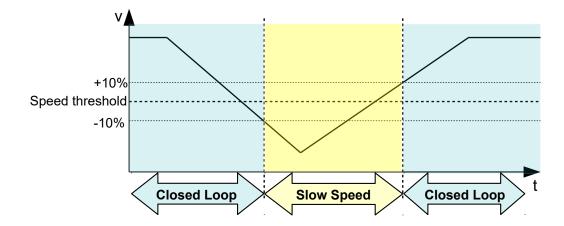

To activate the *slow speed* mode, you must:

- 1. activate closed loop,
- 2. in object <u>3202_h</u> (Motor Drive Submode Select), set bit 7 to "1".

The changeover between *slow speed* and *closed loop* occurs automatically at a speed that is dependent on the physical encoder resolution, with a hysteresis of 10%. This fixed changeover speed is calculated in revolutions per minute as follows:

The following figure shows the changeover as a function of speed in both directions.

While at a standstill, the motor is in *closed loop* mode.

5.1.4.3 Optimizations

The entire phase current remains constant as in *open loop*. Depending on the system, resonances may occur that you can avoid by adjusting the motor current and/or the acceleration ramp. See also chapter <u>Open Loop</u>.

During operation at various speed ranges, if changing between *closed loop* and *slow speed*, it may be necessary to:

- reduce the motor current (objects <u>6075_h</u>, <u>6073_h</u>) if changing from *closed loop* to *slow speed*,
- ascertain various control parameters (see <u>Controller structure</u>) for each speed range.

5.2 CiA 402 Power State Machine

5.2.1 State machine

5.2.1.1 CiA 402

To switch the controller to the ready state, it is necessary to run through a *state machine*. This is defined in *CANopen standard 402*. State changes are requested in object 6040_h (controlword). The actual state of the state machine can be found in object 6041_h (statusword).

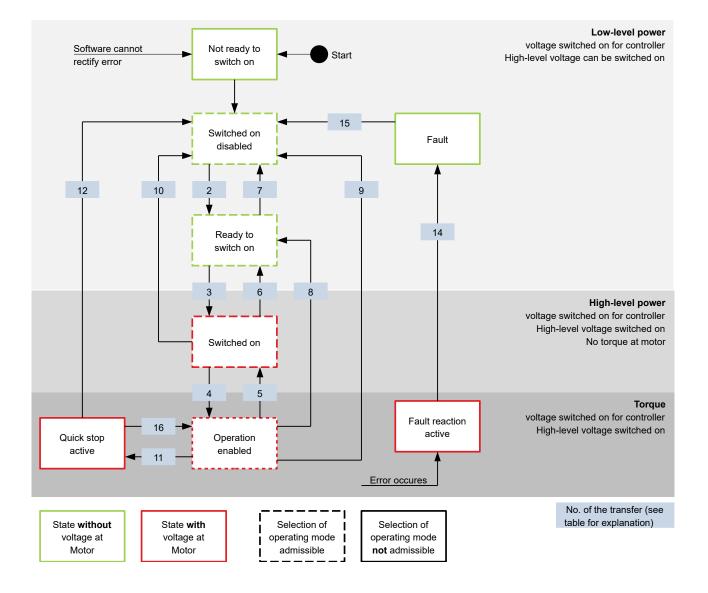

5.2.1.2 Controlword

State changes are requested via object 6040h (controlword).

State transitions

The diagram shows the possible state transitions.

Listed in the following table are the bit combinations for the controlword that result in the corresponding state transitions. An X here corresponds to a bit state that requires no further consideration. Exceptions are the resetting of the error (fault reset) and the changeover from *Quick Stop Active* to *Operation Enabled*: the transition is only requested by the rising edge of the bit.

Command	Bit in object 6040 _h					Transition
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Shutdown	0	Х	1	1	0	2, 6, 8
Switch on	0	0	1	1	1	3
Disable voltage	0	Х	Х	0	Х	7, 10, 9, 12
Quick stop	0	Х	0	1	Х	11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4
Enable operation after Quick stop	0	1	_	1	1	16

Command		Bit	in object	Transition		
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Fault reset		Х	Х	Х	Х	15

5.2.1.3 Statusword

Listed in the following table are the bit masks that break down the state of the controller.

Statusword (6041 _h)	State	
xxxx xxxx x0xx 0000	Not ready to switch on	
xxxx xxxx x1xx 0000	Switch on disabled	
xxxx xxxx x01x 0001	Ready to switch on	
xxxx xxxx x01x 0011	Switched on	
xxxx xxxx x01x 0111	Operation enabled	
xxxx xxxx x00x 0111	Quick stop active	
xxxx xxxx x0xx 1111	Fault reaction active	
xxxx xxxx x0xx 1000	Fault	

After switching on and successfully completing the self-test, the controller reaches the *Switch on disabled* state.

i

Note

If an unrecoverable error occurs, the controller changes to the *Not ready to switch on* state and remains there.

5.2.1.4 Operating mode

The operating mode is set in object $\underline{6060}_h$. The actually active operating mode is displayed in $\underline{6061}_h$. The operating mode can be set or changed at any time.

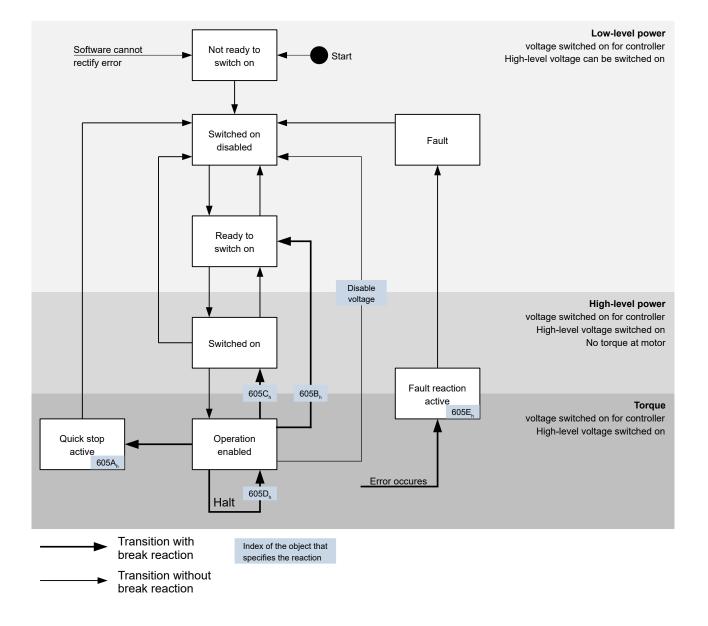

5.2.2 Behavior upon exiting the Operation enabled state

5.2.2.1 Halt motion reactions

Various halt motion reactions can be programmed upon exiting the Operation enabled state.

The following graphic shows an overview of the halt motion reactions.

5.2.2.2 Quick stop active

Transition to the Quick stop active state (quick stop option):

In this case, the action stored in object 605A_h is executed (see following table).

Value in object 605A _h	Description				
0	Immediate stop with subsequent state change to Switch on disabled				
1	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>				
2	Braking with <i>quick stop ramp</i> (<u>6085_h)</u> and subsequent state change to <i>Switch on disabled</i>				
5	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.				

	Value in object 605A _h	Description
6		Braking with <i>quick stop ramp</i> (<u>6085</u> _h) and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

The *Quick stop active* state can also be reached when a limit switch is actuated; see <u>Limitation of the range of motion</u>.

5.2.2.3 Ready to switch on

Transition to the *Ready to switch on* state (shutdown option):

In this case, the action stored in object $\underline{605B}_h$ is executed (see following table).

Value in object 605B _h	Description			
-327681	Reserved			
0	Blocking of the drive function – motor can turn freely			
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode) and subsequent state change to <i>Switch on disabled</i>			
2 32767	Reserved			

5.2.2.4 Switched on

Transition to the Switched on state (disable operation option):

In this case, the action stored in object $\underline{605C}_{h}$ is executed (see following table).

Value in object 605C _h	Description			
-327681	Reserved			
0	Blocking of the drive function – motor can turn freely			
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode) and subsequent state change to <i>Switch on disabled</i>			
2 32767	Reserved			

5.2.2.5 Halt

The bit is valid in the following modes:

- Profile Position
- Velocity
- Profile Velocity
- Profile Torque
- Interpolated Position Mode

When setting bit 8 in object $\underline{6040}_h$ (controlword), the action stored in $\underline{605D}_h$ is executed (see following table):

Value in object 605D _h	Description
-32768 0	Reserved
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (<u>6085_h)</u>
3 32767	Reserved

5.2.2.6 Fault

Case of an error (fault):

If an error occurs, the motor will brake according to the value stored in object $\underline{605E}_{h}$.

Value in object 605E _h	Description
-327681	Reserved
0	Blocking of the drive function – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (<u>6085_h)</u>
3 32767	Reserved

For each error that occurs, a more precise error code is stored in object 1003_h.

5.2.2.7 Following/slippage error

If a following or slippage error occurs, the motor is braked according to the value stored in object 3700h.

Value	Description
-327681	Reserved
0	Blocking of the drive function – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (<u>6085_h)</u>
3 32767	Reserved

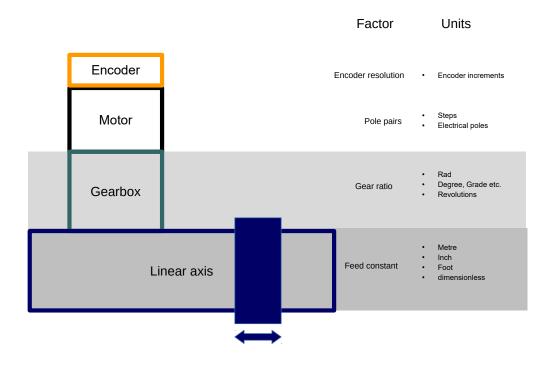

You can deactivate error monitoring by setting object $\underline{6065}_h$ to the value "-1" (FFFFFFF_h) or object $\underline{60F8}_h$ to the value "7FFFFFF_h".

5.3 User-defined units

The controller offers you the possibility to set user-defined units. It is thereby possible to set and read out the corresponding parameters, e.g., directly in degrees [°], millimeter [mm], etc.

Depending on the mechanical circumstances, you can also define a Gear ratio and/or a Feed constant.

Note

Value changes of all objects that are described in this chapter are not immediately applied in the *Operation enabled* state of the <u>CiA 402 Power State Machine</u>. For this to happen, the *Operation enabled* state must be exited.

5.3.1 Units

i

Units of the international unit system (*SI*) as well as a number of specific units are supported. It is also possible to specify a power of ten as a factor.

Listed in the following table are all supported units for the position and their values for $\underline{60A8}_h$ (Position unit) or $\underline{60A9}_h$ (Speed unit). Depending on the unit that is used, Feed constant ($\underline{6092}_h$) and/or Gear ratio ($\underline{6091}_h$) are/is taken into account.

Name	Unit symbol	Value	6091 _h	6092 _h	Description
meter	m	01 _h	yes	yes	Meter
inch	in	C1 _h	yes	yes	<i>Inch</i> (=0.0254 m)
foot	ft	C2 _h	yes	yes	<i>Foot</i> (=0.3048 m)
grade	g	40 _h	yes	no	<i>Gradian</i> (unit of angle, 400 corresponds to 360°)
radian	rad	10 _h	yes	no	Radian
degree	0	41 _h	yes	no	Degrees
arcminute	1	42 _h	yes	no	Arcminute (60'=1°)
arcsecond	"	43 _h	yes	no	Arcsecond (60"=1')
mechanical revolution		B4 _h	yes	no	Revolution

Name	Unit symbol	Value	6091 _h	6092 _h	Description
encoder increment		B5 _h	no	no	<i>Encoder increments.</i> Dependent on the used sensor (encoder/Hall sensor) and <u>control mode</u> . In <i>open loop</i> and <i>sensorless</i> mode, the number of pole pairs (2030 _h) multiplied by 65536 corresponds to one motor revolution.
step		AC _h	no	no	Steps. With 2-phase stepper motors, the number of pole pairs (2030_h) multiplied by 4 is equivalent to one revolution. With 3-phase BLDC motors, the number of pole pairs (2030_h) multiplied by 6 is equivalent to one revolution.
electrical pole		C0 _h	no	no	<i>Electric poles.</i> With a stepper motor that has, e.g., 50 pole pairs (2030 _h), the unit corresponds to 1/50 of a revolution.
dimensionless	5	00 _h	yes	yes	Dimensionless length unit

Listed in the following table are all supported units for the time and their values for 60A9_h (Speed unit):

Name	Unit symbol	Value	Description
second	S	03 _h	Second
minute	min	47 _h	Minute
hour	h	48 _h	Hour
day	d	49 _h	Day
year	а	4A _h	Year (=365.25 days)

Listed in the following table are the possible exponents and their values for $\underline{60A8}_h$ (Position unit) and $\underline{60A9}_h$ (Speed unit):

Factor	Exponent	Value
10 ⁶ 10 ⁵	6	06 _h
10 ⁵	5	05 _h
10 ¹	1	01 _h
10 ⁰ 10 ⁻¹	0	00 _h
10 ⁻¹	-1	FF _h
10 ⁻⁵	-5	FB _h
 10 ⁻⁵ 10 ⁻⁶	-6	FA _h

5.3.2 Encoder resolution

The physical resolution for position measurement of the used encoder/sensor is calculated from the encoder increments ($\underline{60E6}_h$ (Encoder Increments)) per motor revolutions ($\underline{60EB}_h$ (Motor Revolutions)).

5.3.3 Gear ratio

The gear ratio is calculated from motor revolutions ($\underline{60E8}_h$ (Motor Shaft Revolutions)) per axis rotations ($\underline{60ED}_h$ (Driving Shaft Revolutions)).

5.3.4 Feed constant

The feed constant is calculated in user-defined position units from the feed ($\underline{60E9}_h$ (Feed) per revolution of the output shaft ($\underline{60EE}_h$ (Driving Shaft Revolutions).

The feed constant is useful for specifying the lead screw pitch for a linear axis and is used if the unit is based on length dimensions or if it is dimensionless.

5.3.5 Calculation formulas for user units

5.3.5.1 Position unit

Object 60A8_h contains:

- Bits 16 to 23: The position unit (see chapter Units)
- Bits 24 to 31: The exponent of a power of ten (see chapter Units)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Factor									Unit					
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	reserved (00h)									reser	ved (0	0h)			

Example

If $\underline{60A8}_h$ is written with the value "FF410000_h" (bits 16-23=41_h and bits 24-31=FF_h), the unit is set to *tenths of degree* (factory setting).

With a relative target position $(\underline{607A}_h)$ of 3600, the motor moves exactly one mechanical revolution, if <u>Gear ratio</u> is 1:1. The <u>Feed constant</u> plays no role in this case.

Example

If $\underline{60A8}_h$ is written with the value "FD010000_h" (bits 16-23=01_h and bits 24-31=FD_h(=-3)), the unit is set to *millimeter*.

With a relative target position $(\underline{607A}_h)$ of 1, the motor moves exactly one mechanical revolution, if <u>Feed constant</u> and <u>Gear ratio</u> are 1:1.

If the <u>Feed constant</u> is set according to the lead screw pitch of a linear axis, the motor turns far enough that a feed of 1 mm is achieved.

Described in chapter <u>Assignment of the feedbacks to the control loops</u> is how you can determine which encoder/sensor is to be used for position control and measurement.

5.3.5.2 Speed unit

Object 60A9h contains:

- Bits 8 to 15: The time unit (see chapter Units)
- Bits 16 to 23: The position unit (see chapter <u>Units</u>)
- Bits 24 to 31: The exponent of a power of ten (see chapter <u>Units</u>)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Factor							N	omina	tor (Po	sition)				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Denominator (Time)								r	eserve	d (00h)			

Example

If $\underline{60A9}_h$ is written with the value "00B44700_h" (bits 8-15=00_h, bits 16-23=B4_h and bits 24-31=47_h), the unit is set to *revolutions per minute* (factory setting).

Example

If $\underline{60A9}_h$ is written with the value "FD010300_h" (bits 8-15=FD_h(=-3), bits 16-23=01_h and bits 24-31=03_h), the unit is set to *millimeters per second*.

Described in chapter <u>Assignment of the feedbacks to the control loops</u> is how you can determine which encoder/sensor is to be used for speed control and measurement.

The speed unit in <u>Velocity</u> mode is preset to *revolutions per minute*. You can only set the unit via the 604Ch VI Dimension Factor.

Note

Conversion factor for the speed unit

You can set an additional factor for the speed unit. Thus, a unit of, e.g., 1/3 revolutions/minute is possible. The factor n is calculated from the factor for numerator ($\underline{6096}_h$:01_h) divided by the factor for denominator ($\underline{6096}_h$:02_h).

$$n_{velocity} = -\frac{6096_{h}:01}{6096_{h}:02}$$

5.3.5.3 Acceleration unit

The acceleration unit is speed unit per second.

Conversion factor for the acceleration unit

The factor n for the acceleration unit is calculated from the numerator $(\underline{6097}_h:01_h)$ divided by the denominator $(\underline{6097}_h:02_h)$.

 $n_{acceleration} = \frac{6097_{h}:01}{6097_{h}:02}$

5.3.5.4 Jerk unit

The jerk unit is Acceleration unit per second.

Conversion factor for jerk

The factor n for the jerk is calculated from the numerator $(\underline{60A2}_h:01_h)$ divided by the denominator $(\underline{60A2}_h:02_h)$.

$$n_{jerk} = \frac{60A2_{h}:01}{60A2_{h}:02}$$

5.4 Limitation of the range of motion

The digital inputs can be used as limit switches, as is described in chapter <u>Digital inputs</u>, if you activate this function for the inputs. The controller also supports software limit switches.

5.4.1 Behavior upon reaching the limit switch

If a limit switch is passed over, bit 7 (*Warning*) is set in 6041_h (*statusword*) and the action that is stored in object 3701_h executed (see following table).

Value in object 3701 _h	Description
-1 (factory settings)	No reaction (e.g., to execute a homing operation)
1	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>
2	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Switch on disabled</i>
5	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.
6	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

As long as the limit switch is still active, travel in the direction of the limit switch is blocked; it is, however, possible to travel in the opposite direction.

Bit 7 (*Warning*) in <u>6041_h</u> is not deleted until the limit switch is deactivated and the limit switch position has been passed back over.

The quick-stop bit (bit 2) in 6040_h is not automatically set to "0" when the state changes to *Quick stop active*.

Note

▶ If you want to change the <u>state machine</u> back to the Operation enabled state, you must set the bit to "0" and then to "1" again.

5.4.2 Software limit switches

The controller takes into account software limit switches ($\underline{607D}_h$ (Software Position Limit)). Target positions ($\underline{607A}_h$) are limited by $\underline{607D}_h$; the absolute target position may not be larger than the limits in $\underline{607D}_h$. If the motor is located outside of the permissible range when setting up the limit switches, only travel commands in the direction of the permissible range are accepted.

5.5 Cycle times

i

The controller operates with a cycle time of 1 ms. This means that data are processed every 1 ms; multiple changes to a value (e.g., value of an object or level at a digital input) within one ms cannot be detected.

The following table includes an overview of the cycle times of the various processes.

Task	Cycle time
Application	1 ms
NanoJ application	1 ms

Task	Cycle time
Current controller	62.5 μs (16 kHz)
Velocity controller	250 μs (4 kHz)
Position controller	1 ms

6 Operating modes

6.1 Profile Position

6.1.1 Overview

6.1.1.1 Description

Profile Position Mode is used to move to positions relative to the last target position or to an absolute position (last reference position). During the movement, the limit values for the speed, starting acceleration/ braking deceleration and jerks are taken into account.

6.1.1.2 Activation

To activate the mode, the value "1" must be set in object $\underline{6060}_h$ (Modes Of Operation) (see "<u>CiA 402 Power</u> <u>State Machine</u>").

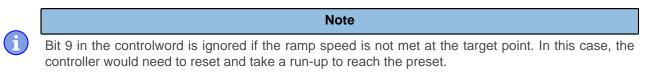

6.1.1.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 4 starts a travel command. This is carried out on a transition from "0" to "1". An exception occurs if changing from another operating mode to *profile position*: If bit 4 is already set, it does not need to be set to "0" and then back to "1" in order to start the travel command.
- Bit 5: If this bit is set to "1", a travel command triggered by bit 4 is immediately executed. If it is set to "0", the just executed travel command is completed and only then is the next travel command started.
- Bit 6: With "0", the target position (<u>607A_h</u>) is absolute and with "1" the target position is relative. The reference position is dependent on bits 0 and 1 of object <u>60F2_h</u>.
- Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the set start ramp to the target speed. On a transition from "0" to "1", the motor brakes and comes to a standstill. The braking deceleration is dependent here on the setting of the "Halt Option Code" in object 605D_h.
- Bit 9 (Change on setpoint): If this bit is set, the speed is not changed until the first target position is reached. This means that, before the first target is reached, no braking is performed, as the motor should not come to a standstill at this position.

Controlword 6040 _h							
Bit 9	Bit 5	Definition					
Х	1	The new target position is moved to immediately.					
0	0	Positioning is completed before moving to the next target position with the new limits.					
1	0	The current target position is only passed through; afterwards, the new target position is moved to with the new values.					

For further information, see figure in "Setting travel commands".

6.1.1.4 Statusword

The following bits in object $\underline{6041}_h$ (statusword) have a special function:

- Bit 10 (Target Reached): This bit is set to "1" if the last target was reached and the motor remains within a tolerance window (6067_h) for a preset time (6068_h).
- Bit 11: Limit exceeded: The demand position is above or below the limit values set in 607D_h.
- Bit 12 (Set-point acknowledge): This bit confirms receipt of a new and valid set point. It is set and reset in sync with the "New set-point" bit in the controlword.

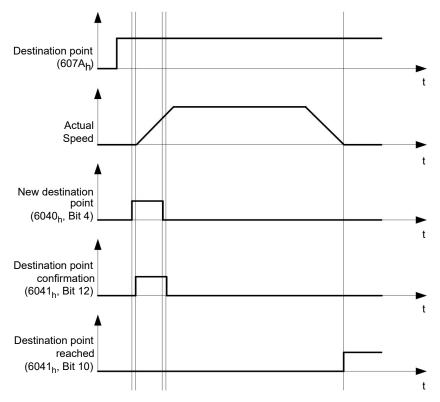

There is an exception in the event that a new movement is started before another one has completed and the next movement is not to occur until after the first one has finished. In this case, the bit is reset if the command was accepted and the controller is ready to execute new travel commands. If a new travel command is sent even though this bit is still set, the newest travel command is ignored. The bit is not set if one of the following conditions is met:

- □ The new target position can no longer be reached while adhering to all boundary conditions.
- □ A target position was already traveled to and a target position was already specified. A new target position can only be specified after the current positioning has been concluded.
- Bit 13 (Following Error): This bit is set in *closed loop* mode if the following error is greater than the set limits (<u>6065_h</u> (Following Error Window) and <u>6066_h</u> (Following Error Time Out)).

6.1.2 Setting travel commands

6.1.2.1 Travel command

In object $\underline{607A}_h$ (Target Position), the new target position is specified in user units (see <u>User-defined units</u>). The travel command is then triggered by setting bit 4 in object $\underline{6040}_h$ (controlword). If the target position is valid, the controller responds with bit 12 in object $\underline{6041}_h$ (statusword) and begins the positioning move. As soon as the position is reached, bit 10 in the statusword is set to "1".

The controller can also reset bit 4 in object $\underline{6040}_h$ (controlword) on its own. This is set with bits 4 and 5 of object $\underline{60F2}_h$.

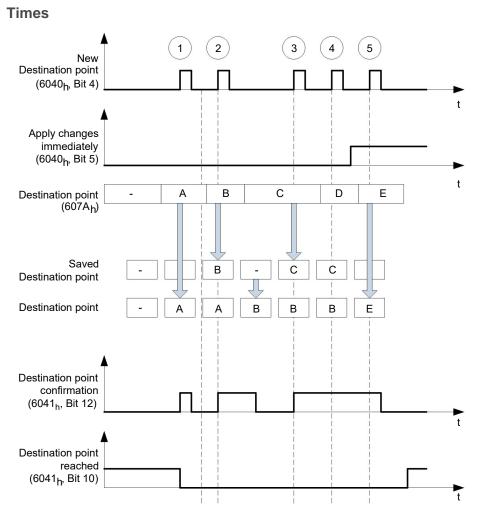

6.1.2.2 Other travel commands

Bit 12 in object $\underline{6041}_h$ (statusword, set-point acknowledge) changes to "0" if another travel command can be buffered (see time 1 in the following figure). As long as a target position is being moved to, a second target position can be passed to the controller in preparation. All parameters – such as speed, acceleration, braking deceleration, etc. – can thereby be reset (time 2). If the buffer is empty, the next time can be queued up (time 3).

6 Operating modes

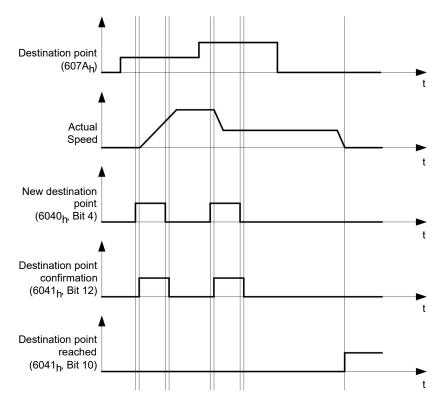

If the buffer is already full, a new set point is ignored (time 4). If bit 5 in object <u>6040</u>_h (controlword, bit: "Change Set-Point Immediately") is set, the controller operates without the buffer; new travel commands are implemented directly (time 5).

Transition procedure for second target position

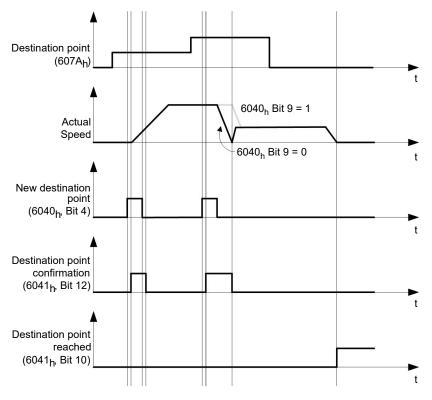

The following graphic shows the transition procedure for the second target position while moving to the first target position. In this figure, bit 5 of object 6040_h (controlword) is set to "1"; the new target value is, thus, taken over immediately.

Possibilities for moving to a target position

If bit 9 in object $\underline{6040}_h$ (controlword) is equal to "0", the current target position is first moved to completely. In this example, the final speed ($\underline{6082}_h$) of the target position is equal to zero. If bit 9 is set to "1", the profile speed ($\underline{6081}_h$) is maintained until the target position is reached; only then do the new boundary conditions apply.

Possible combinations of travel commands

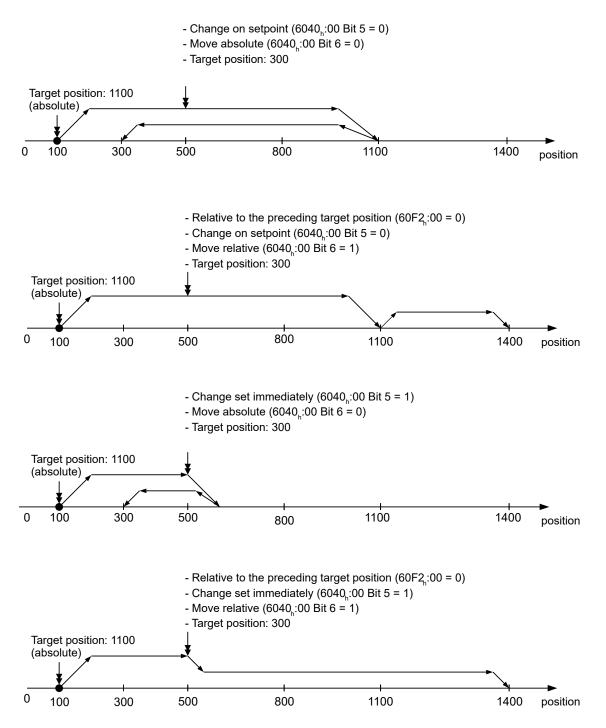

To provide a better overview of the travel commands, combinations of travel commands are listed and depicted in this chapter.

6 Operating modes

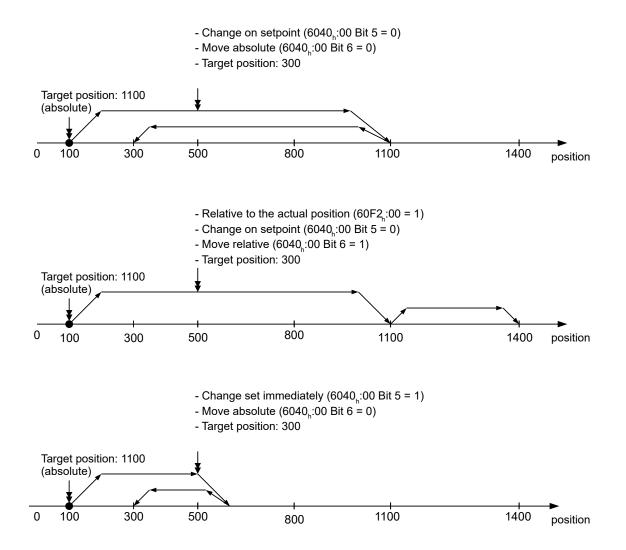

The following applies for the figures below:

- A double arrow indicates a new travel command.
- The first travel command at the start is always an absolute travel command to position 1100.
- The second movement is performed at a lower speed so as to present the graphs in a clear manner.

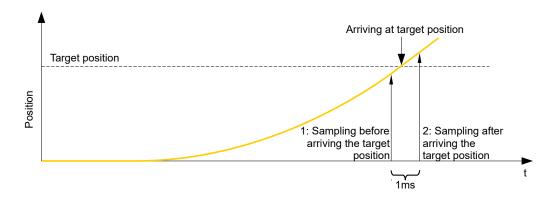

6.1.3 Loss of accuracy for relative movements

When linking together relative movements, a loss of accuracy may occur if the final speed is not set to zero. The following graphic illustrates the reason.

The current position is sampled once per millisecond. It is possible that the target position is reached between two samples. If the final speed is not equal to zero, then, after the target position is reached, the sample is used as an offset as the basis for the subsequent movement. As a result, the subsequent movement may go somewhat farther than expected.

6.1.4 Boundary conditions for a positioning move

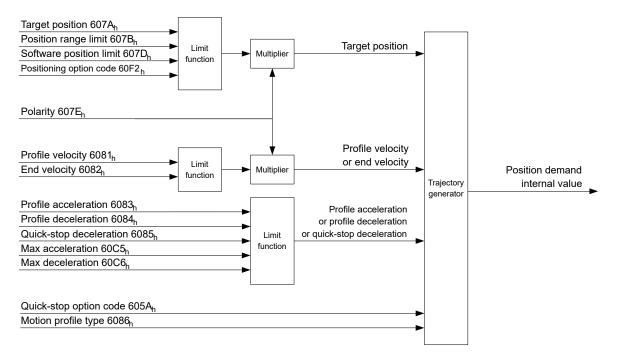

6.1.4.1 Object entries

The boundary conditions for the position that has been moved to can be set in the following entries of the object dictionary:

- <u>607A_h</u>: (Target Position): Planned target position
- <u>607D</u>_h: (Software Position Limit): Definition of the limit stops (see chapter <u>Software limit switches</u>)
- <u>607C</u>_h (Home Offset): Specifies the difference between the zero position of the controller and the reference point of the machine in <u>user-defined units</u>. (See "<u>Homing</u>")
- <u>607B</u>_h (Position Range Limit): Limits of a modulo operation for replicating an endless rotation axis
- <u>607</u>_h (Polarity): Direction of rotation
- <u>6081_h</u> (Profile Velocity): Maximum speed with which the position is to be approached
- <u>6082</u>_h (End Velocity): Speed upon reaching the target position
- <u>6083</u>_h (Profile Acceleration): Desired starting acceleration
- <u>6084</u>_h (Profile Deceleration): Desired braking deceleration
- <u>6085</u>_h (Quick Stop Deceleration): Emergency-stop braking deceleration in case of the "Quick stop active" state of the "CiA 402 Power State Machine"
- 6086_h (Motion Profile Type): Type of ramp to be traveled; if the value is "0", the jerk is not limited; if the value is "3", the values of $60A4_h:1_h-4_h$ are set as limits for the jerk.
- <u>60C5</u>_h (Max Acceleration): The maximum acceleration that may not be exceeded when moving to the end position
- <u>60C6</u>_h (Max Deceleration): The maximum braking deceleration that may not be exceeded when moving to the end position
- $60A4_h$ (Profile Jerk), subindex 01_h to 04_h : Objects for specifying the limit values for the jerk.
- The speed is is limited by <u>607F_h</u> (Max Profile Velocity) and <u>6080_h</u> (Max Motor Speed); the smaller value is used as the limit.
- <u>60F2_h</u>: (Positioning Option Code): Defines the positioning behavior
- <u>60B0</u>_h (Position Offset): Offset for the position set value in <u>user-defined units</u>

6.1.4.2 Objects for the positioning move

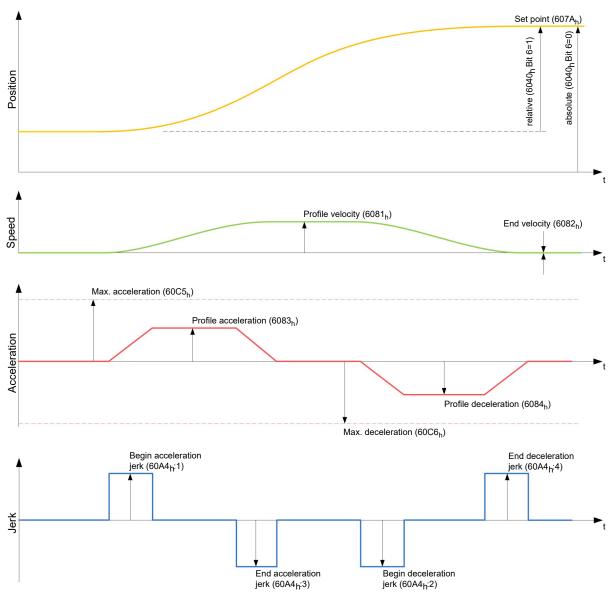

The following graphic shows the objects involved in the boundary conditions of the positioning move.

6.1.4.3 Parameters for the target position

The following graphic shows an overview of the parameters that are used for moving to a target position (figure not to scale).

6.1.5 Jerk-limited mode and non-jerk-limited mode

6.1.5.1 Description

A distinction is made between the "jerk-limited" and "non-jerk-limited" modes.

6.1.5.2 Jerk-limited mode

Jerk-limited positioning can be achieved by setting object $\underline{6086}_h$ to "3". The entries for the jerks in subindices :1_h-4_h of object $\underline{60A4}$ thereby become valid.

6.1.5.3 Non-jerk-limited mode

A "non-jerk-limited" ramp is traveled if the entry in object <u>6086_h</u> is set to "0" (default setting).

6.2 Velocity

6.2.1 Description

This mode operates the motor at a preset target speed, similar to a frequency inverter. Unlike the *profile velocity mode*, this mode does not permit the selection of jerk-limited ramps.

6.2.2 Activation

To activate the mode, the value "2" must be set in object <u>6060_h</u> (Modes Of Operation) (see "<u>CiA 402 Power</u> <u>State Machine</u>").

6.2.3 Controlword

The following bits in object $\underline{6040}_h$ (controlword) have a special function:

Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the acceleration ramp to the target speed. On a transition from "0" to "1", the motor brakes according to the deceleration ramp and comes to a standstill.

6.2.4 Statusword

The following bits in object $\underline{6041}_{h}$ (statusword) have a special function:

Bit 11: Limit exceeded: The target speed is above or below the set limit values.

6.2.5 Object entries

The following objects are necessary for controlling this mode:

■ <u>604C_h</u> (Dimension Factor):

The unit for speed values is defined here for the following objects.

Subindex 1 contains the denominator (multiplier) and subindex 2 contains the numerator (divisor) with which the internal speed values are converted to revolutions per minute. If, for example, subindex 1 is set to the value "60" and subindex 2 is set to the value "1", the speed is specified in revolutions per second (60 revolutions per 1 minute).

- <u>6042_h</u>: Target Velocity.
 The target speed is set here in user-defined units.
- <u>6048</u>_h: Velocity Acceleration
 This object defines the acceleration. Subindex 1 contains the change in speed, subindex 2 the corresponding time in seconds. Both together are used to calculate the acceleration:

VL velocity acceleration =
$$\frac{\text{Delta speed (6048}_{h}:1)}{\text{Delta time (6048}_{h}:2)}$$

■ <u>6049</u>_h (Velocity Deceleration):

This object defines the deceleration (deceleration ramp). The subindices here are arranged as described in object $\underline{6048}_{h}$; the change in speed is to be specified with positive sign.

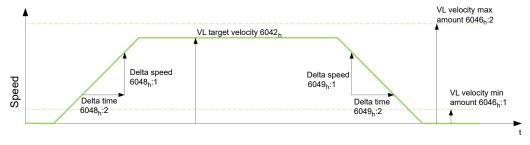

- <u>6046_h</u> (Velocity Min Max Amount): The limitations of the target speeds are specified in this object. The minimum speed is set in <u>6046_h</u>:1_h. If the target speed (<u>6042_h</u>) falls below the minimum speed, the value is limited to the minimum speed <u>6046_h</u>:1_h. The maximum speed is set in <u>6046_h</u>:2_h. If the target speed (<u>6042_h</u>) exceeds the maximum speed, the value is limited to the maximum speed <u>6046_h</u>:2_h.
- <u>604A_h</u> (Velocity Quick Stop): This object can be used to set the quick-stop ramp. Subindices 1 and 2 are identical to those described for object <u>6048_h</u>.
- <u>60B1</u>_h (Velocity Offset): Offset for the speed set value in <u>user-defined units</u>

The following objects can be used to check the function:

- <u>6043</u>_h (VI Velocity Demand)
- <u>6044</u>_h (VI Velocity Actual Value)

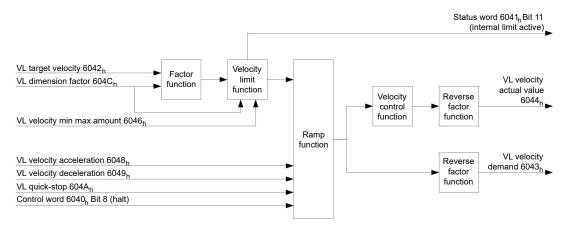

6.2.5.1 Speeds in Velocity Mode

6.2.5.2 Objects for Velocity Mode

The ramp generator follows the target speed, remaining within the set speed and acceleration limits. As long as a limit is active, bit 11 in object 6041_h is set (internal limit active).

6.3 Profile Velocity

6.3.1 Description

This mode operates the motor in Velocity Mode with extended (jerk-limited) ramps. Unlike *Velocity Mode* (see "<u>Velocity</u>"), the <u>statusword</u> is used in this mode to indicate whether the target speed is reached.

6.3.2 Activation

To activate the mode, the value "3" must be set in object $\underline{6060}_h$ (Modes Of Operation) (see "CiA 402 Power State Machine").

6.3.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the set start ramp to the target speed. On a transition from "0" to "1", the motor brakes and comes to a standstill.

6.3.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

Bit 10 (target speed reached; Target Reached): In combination with bit 8 in the controlword, this bit specifies whether the target speed is reached, if braking is taking place or if the motor is at a standstill (see table).

	••	040 _h Bit 8	Description
0	0	٦	arget speed not reached
0	1	A	Axis braking
1	0		Farget speed within target window (defined in <u>606D_hh</u> and <u>606E_h)</u>
1	1	ŀ	Axis speed is 0

- Bit 12: This bit indicates whether the actual speed is zero.
 If the actual speed is greater than the value in <u>606F_h</u>(Velocity Threshold) for a time of <u>6070_h</u>(Velocity Threshold Time), this bit has the value "0". The bit otherwise remains set to "1".
- Bit 13 (Deviation Error): This bit is set in *closed loop* mode if the slippage error is greater than the set limits (<u>60F8h Max Slippage</u> and <u>203Fh Max Slippage Time Out</u>).

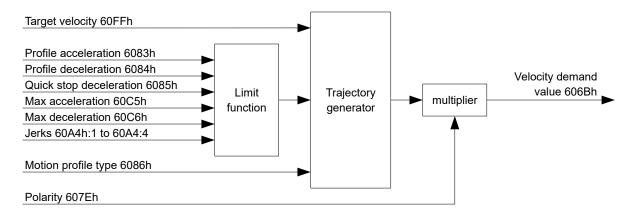

6.3.5 Object entries

The following objects are necessary for controlling this mode:

- <u>606B</u>_h (Velocity Demand Value): This object contains the output of the ramp generator, which simultaneously serves as the preset value for the velocity controller.
- <u>606C</u>_h (Velocity Actual Value): Indicates the current actual speed.
- <u>606D</u>_h (Velocity Window): This value specifies by how much the actual speed may vary from the set speed for bit 10 (target speed reached; Target Reached") in object <u>6041</u>_h (statusword) to be set to "1".
- <u>606E_h</u> (Velocity Window Time): This object specifies how long the actual speed and the set speed must be close to one another (see <u>606D_h</u> "Velocity Window") for bit 10 "Target speed reached" in object <u>6041_h</u> (statusword) to be set to "1".
- <u>607E_h</u> (Polarity):
 If bit 6 is set to "1" here, the sign of the target speed is reversed.
- <u>6083</u>_h (Profile acceleration): Sets the value for the acceleration ramp.
- <u>6084</u>_h (Profile Deceleration): Sets the value for the deceleration ramp.
- <u>6085</u>_h (Quick Stop Deceleration): Sets the value for the deceleration ramp for rapid braking.
- <u>6086</u>_h (Motion Profile Type): The ramp type can be selected here ("0" = trapezoidal ramp, "3" = jerk-limited ramp).
- <u>60FF</u>_h (Target Velocity):
 Specifies the target speed that is to be reached.
- The speed is is limited by <u>607F_h</u> (Max Profile Velocity) and <u>6080_h</u> (Max Motor Speed); the smaller value is used as the limit.
- <u>60B1</u>_h (Velocity Offset): Offset for the speed set value in <u>user-defined units</u>

6.3.5.1 Objects in Profile Velocity Mode

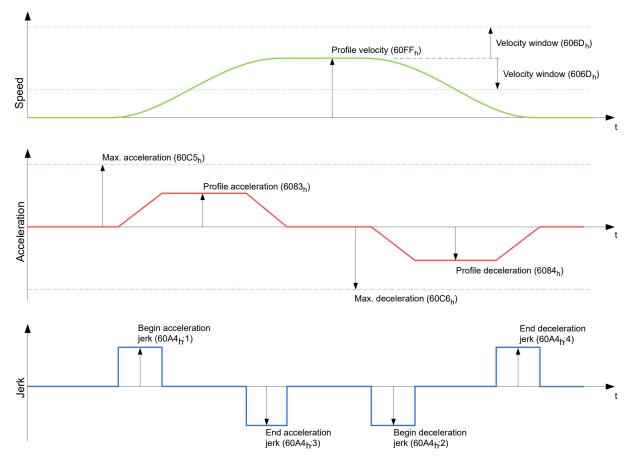

6.3.5.2 Activation

After the mode is selected in object $\underline{6060}_h$ (Modes Of Operation) and the "Power State machine" (see "<u>CiA 402 Power State Machine</u>") is switched to *Operation enabled*, the motor is accelerated to the target speed in object $\underline{60FF}_h$ (see following figures). The speed and acceleration values are taken into account here; for jerk-limited ramps, the jerk-limit values are also taken into account.

6.3.5.3 Limitations in the jerk-limited case

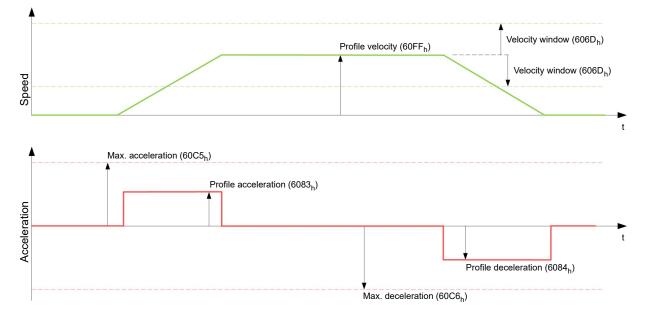

The following figure shows the adjustable limits in the jerk-limited case $(\underline{6086}_{h} = 3)$.

6.3.5.4 Limitations in the trapezoidal case

This figure shows the adjustable limitations for the trapezoidal case $(\underline{6086}_{h} = 0)$.

6.4 Profile Torque

6.4.1 Description

In this mode, the torque is preset as a set value and reached via a ramp function.

6.4.2 Activation

To activate the mode, the value "4" must be set in object $\underline{6060}_h$ (Modes Of Operation) (see "CiA 402 Power State Machine").

6.4.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

Bit 8 (Halt): If this bit is set to "1", the motor stops. If this bit is set from "1" to "0", the motor is started up according to the presets. When setting from "0" to "1", the motor is again brought to a standstill, taking the preset values into consideration.

6.4.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

Bit 10 (Target Reached): In combination with bit 8 of object <u>6040_h</u> (controlword), this bit indicates whether the specified torque is reached (see following table). The target is considered having been met if the current torque (<u>6077h Torque Actual Value</u>) is within a tolerance window (<u>203Dh Torque Window</u>) for a specified time (<u>203Eh Torque Window Time Out</u>).

6040 _h Bit 8	6041 _h Bit 10	Description
0	0	Specified torque not reached
0	1	Specified torque reached
1	0	Axis brakes
1	1	Axis speed is 0

Bit 11: Limit exceeded: The target torque $(\underline{6071}_h)$ exceeds the maximum torque entered in $\underline{6072}_h$.

6.4.5 Object entries

All values of the following entries in the object dictionary are to be specified as a thousandth of the maximum torque, which corresponds to the rated current $(203B_h:01_h)$. This includes the objects:

- <u>6071_h</u> (Target Torque): Target torque
- <u>6072</u>_h (Max Torque): Maximum torque during the entire ramp (accelerate, maintain torque, decelerate)
- <u>6073</u>_h (Max Current):

i

- Maximum current. The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h .
- <u>6074</u>_h (Torque Demand):
 Current output value of the ramp generator (torque) for the controller
- <u>6087</u>_h (Torque Slope): Max. change in torque per second
- <u>60B2</u>_h (Torque Offset): Offset for the torque set value in tenths of a percent

Note

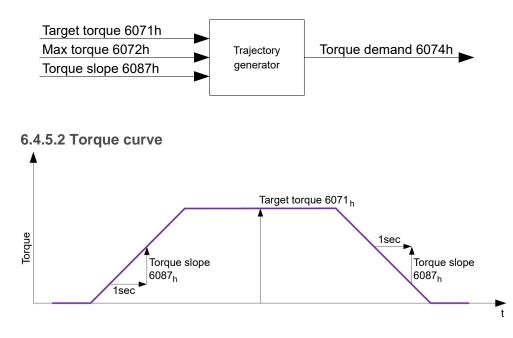

These values are not limited to 100% of the rated current ($203B_h:01_h$). Torque values greater than the rated torque (generated from the rated current) can be achieved if the maximum duration ($203B_h:02_h$) of the maximum current (6073_h) is set (see <u>12t Motor overload protection</u>). All torque objects are limited by the maximum motor current (2031_h).

The following objects are also needed for this operating mode:

<u>3202</u>_h Bit 5 (Motor Drive Submode Select):

If this bit is set to "0", the drive controller is operated in the torque-limited Velocity Mode, i.e., the maximum speed can be limited in object <u>6080_h</u> and the controller can operate in field weakening mode. If this bit is set to "1", the controller operates in the ("Real") Torque Mode; the maximum speed cannot be limited here and field weakening mode is not possible.

6.4.5.1 Objects of the ramp generator

6.5 Homing

6.5.1 Overview

6.5.1.1 Description

The purpose of the homing method is to align the position zero point of the controller with an encoder index or position switch.

6.5.1.2 Activation

To activate the mode, the value "6" must be set in object $\underline{6060}_h$ (Modes Of Operation) (see "<u>CiA 402 Power</u> <u>State Machine</u>").

If home switches and/or limit switches are used, these special functions must first be activated in the I/O configuration (see "Digital inputs and outputs").

Tip

To use the limit switch, you must also set object 3701_h to "-1" (factory setting) to prevent blocking the further travel of the motor.

6.5.1.3 Controlword

The following bits in object <u>6040_h</u> (controlword) have a special function:

Bit 4: If the bit is set to "1", referencing is started. This is performed until either the reference position is reached or bit 4 is reset to "0".

6.5.1.4 Statusword

Bit 13	Bit 12	Bit 10	Description
0	0	0	Homing is performed
0	0	1	Homing is interrupted or not started
0	1	0	Homing has been performed since the last restart but target is not currently reached
0	1	1	Homing completed
1	0	0	Error during homing, motor still turning
1	0	1	Error during homing, motor at standstill

The following bits in object 6041_h (statusword) have a special function:

Note

Bit 12 in *Homing* mode is set to 1 after the first fully completed homing operation since the restart. It is only reset to 0

- during all subsequent homing operations
- in the event of an error during a homing operation (permanently deleted until a new homing operation is fully completed).

6.5.1.5 Object entries

i

The following objects are necessary for controlling this mode:

<u>607C</u>_h (Home Offset): Specifies the difference between the zero position of the controller and the reference point of the machine in <u>user-defined units</u>.

■ <u>6098_h</u> (Homing Method):

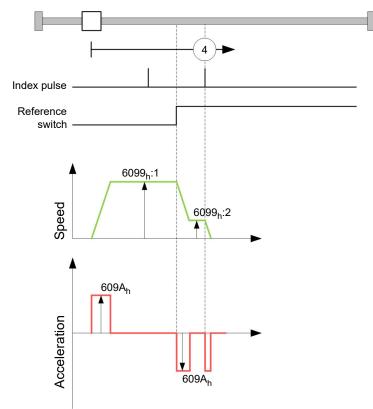

Method to be used for referencing (see "<u>Homing method</u>")

- <u>6099</u>_h:01_h (Speed During Search For Switch): Speed for the search of the switch
- <u>6099</u>_h:02_h (Speed During Search For Zero): Speed for the search of the index
- <u>6080</u>_h (Max Motor Speed): Maximum speed
- <u>609A_h</u> (Homing Acceleration): Starting acceleration and braking deceleration for homing
- <u>203A</u>_h:01_h (Minimum Current For Block Detection): Minimum current threshold which, if exceeded, is to detect the blocking of the motor at a block.
 <u>203A</u>_h:02_h (Period Of Blocking):

Specifies the time in ms that the motor is to continue to run against the block after block detection.

Homing speeds

The figure shows the homing speeds using method 4 as an example:

6.5.2 Homing method

6.5.2.1 Description

The homing method is written as a number in object 6098_h and decides whether, on a switch edge (rising/ falling), a current threshold for block detection or an index pulse is referenced or in which direction homing starts. Methods that use the index pulse of the encoder lie in the number range 1 to 14, 33 and 34. Methods that do not use the index pulse of the encoder lie between 17 and 30, but are identical to methods 1 to 14 with respect to the travel profiles. These number are shown in circles in the following figures. Methods for which no limit switches are used and, instead, travel against a block is to be detected, a minus must be placed before the method number when making the call.

In the following graphics, the negative movement direction is to the left. The *limit switch* is located before the respective mechanical block; the *home switch* is located between the two limit switches. The index pulses come from the connected encoder.

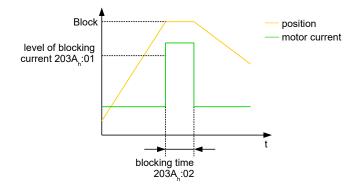

For methods that use homing on block, the same figures apply as for the methods with limit switch. Because nothing is different aside from the missing limit switches, the same figures are used. For the figures here, the limit switches must be replaced with a mechanical block.

6.5.2.2 Homing on block

Homing on block currently only functions in *closed loop* mode.

"Homing on block" functions like every homing method with the difference that instead of a limit switch, a block (limit stop) is used for positioning. Two settings are to be made here:

- Current level: In object <u>203A_h</u>:01, the current level is defined above which movement against the block is detected.
- 2. Blocking duration: In object <u>203A_h</u>:02, the duration during which the motor moves against the block is set.

6.5.2.3 Overview of methods

Methods 1 to 14 as well as 33 and 34 use the index pulse of the encoder.

Methods 17 to 32 are identical to methods 1 to 14 with the difference that only limit or home switches are used for referencing and not the index pulse.

- Methods 1 to 14 use an index pulse.
- Methods 17 to 30 do not use an index pulse.
- Methods 33 and 34 reference only to the next index pulse.
- Method 35 references to the current position.

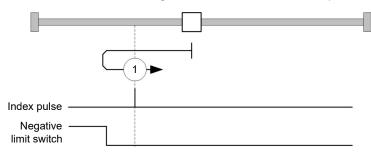

The following methods can be used for homing on block:

- Methods -1 to -2 and -7 to -14 contain an index pulse
- Methods -17 to -18 and -23 to -30 have no index pulse

6.5.2.4 Methods 1 and 2

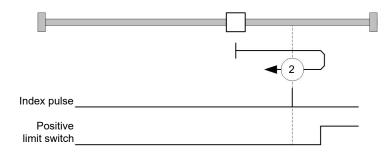

Reference to limit switches and index pulse.

Method 1 references to negative limit switch and index pulse:

Method 2 references to positive limit switch and index pulse:

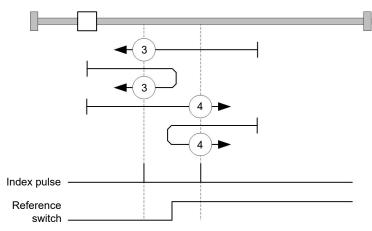

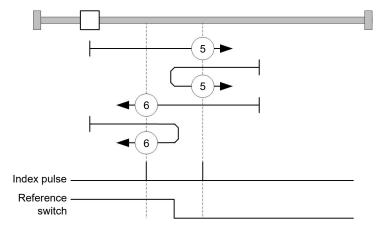

6.5.2.5 Methods 3 to 6

Reference to the switching edge of the home switch and index pulse.

With methods 3 and 4, the left switching edge of the home switch is used as reference:

With methods 5 and 6, the right switching edge of the home switch is used as reference:

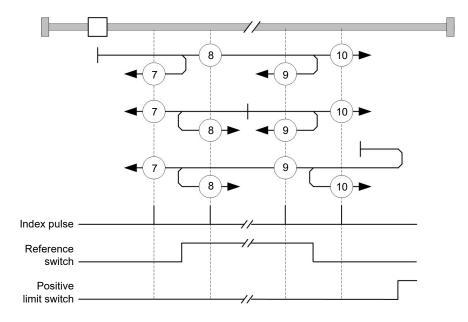

6.5.2.6 Methods 7 to 14

Reference to the home switch and index pulse (with limit switches).

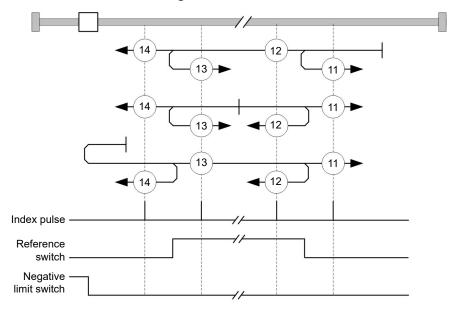

With these methods, the current position relative to the home switch is not important. With method 10, for example, referencing is always performed to the index pulse to the right of the right edge of the home switch.

Methods 7 to 10 take the positive limit switch into account:

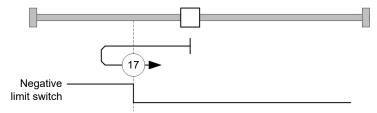

Methods 11 to 14 take the negative limit switch into account:

6.5.2.7 Methods 17 and 18

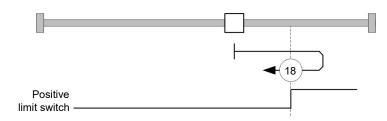

Reference to the limit switch without the index pulse.

Method 17 references to the negative limit switch:

Method 18 references to the positive limit switch:

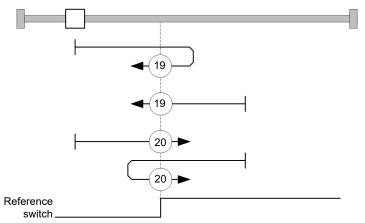

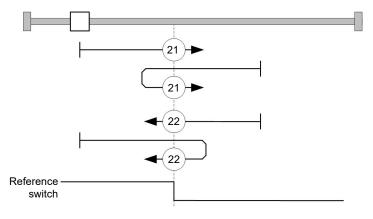

6.5.2.8 Methods 19 to 22

Reference to the switching edge of the home switch without the index pulse.

With methods 19 and 20 (equivalent to methods 3 and 4), the left switching edge of the home switch is used as reference:

With methods 21 and 22 (equivalent to methods 5 and 6), the right switching edge of the home switch is used as reference:

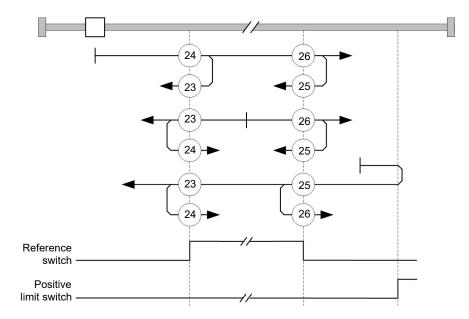

6.5.2.9 Methods 23 to 30

Reference to the home switch without the index pulse (with limit switches).

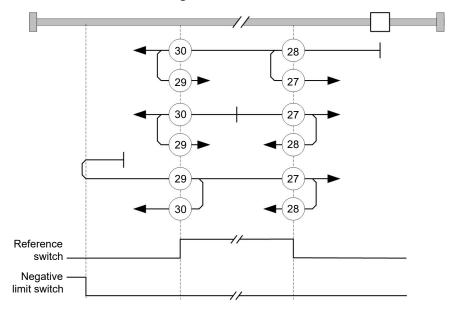

With these methods, the current position relative to the home switch is not important. With method 26, for example, referencing is always performed to the index pulse to the right of the right edge of the home switch.

Methods 23 to 26 take the positive home switch into account:

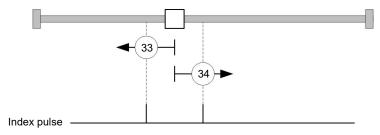

Methods 27 to 30 take the negative home switch into account:

6.5.2.10 Methods 33 and 34

Reference to the next index pulse.

With these methods referencing is only performed to the respective subsequent index pulse:

6.5.2.11 Method 35

References to the current position.

Note

For homing mode 35, it is not necessary to switch the <u>CiA 402 Power State Machine</u> to the "Operation enabled" state. When energizing the motor windings in *open loop* mode, it is thereby possible to prevent the current position from not being exactly 0 after Homing Mode 35.

6.6 Clock-direction mode

6.6.1 Description

In clock-direction mode, the motor is operated via two inputs by a higher-level positioning controller with clock and direction signal. On each clock signal, the motor moves one step in the direction corresponding to the direction signal.

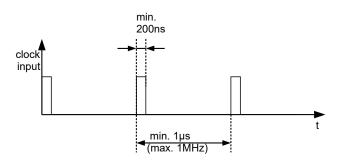

6.6.2 Activation

To activate the mode, the value "-1" (or "FFh") must be set in object <u>6060_h</u> (Modes Of Operation) (see "<u>CiA</u> <u>402 Power State Machine</u>").

6.6.3 General

The following data apply for every subtype of the clock-direction mode:

The maximum frequency of the input pulse is 1 MHz; the ON pulse should not be less than 200 ns.

- The demand position resulting from the input pulses is updated cyclically; the cycle time corresponds to the Interpolation Time Period (<u>60C2_h</u>). The input pulses that arrive within a cycle are collected and buffered in the controller.
- The steps are scaled using objects 2057_h and 2058_h . The following formula applies here:

step width per pulse =
$$\frac{2057_{h}}{2058_{h}}$$

The "step size per pulse" value is set to 128 (2057_h =128 and 2058_h =1) ex works, which corresponds to a quarter step per pulse. A full step is the value "512", a half step per pulse corresponds to "256", etc.

Note

For a stepper motor with 50 pole pairs, 200 full steps correspond to one mechanical revolution of the motor shaft.

In *clock-direction mode*, the BLDC motors are also handled as stepper motors by the controller. This means that for a BLDC motor with, e.g., 3 pole pairs, 12 (=4*3) full steps correspond to one revolution.

i

Note

If there is a change of direction, a time of at least 35 μ s must elapse before the new clock signal is applied.

6.6.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

 Bit 13 (Following Error): This bit is set in *closed loop* mode if the following error is greater than the set limits (<u>6065_h</u> (Following Error Window) and <u>6066_h</u> (Following Error Time Out)).

6.6.5 Subtypes of the clock-direction mode

6.6.5.1 Clock-direction mode (TR mode)

To activate the mode, object 205B_h must be set to the value "0" (factory settings).

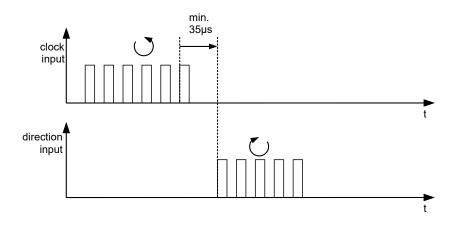

In this mode, the pulses must be preset via the clock input; the signal of the direction input specifies the direction of rotation here (see following graphic).

6.6.5.2 Right / left rotation mode (CW / CCW mode)

To activate the mode, object $205B_h$ must be set to the value "1".

In this mode, the input that is used decides the direction of rotation (see following graphic).

6.7 Auto setup

6.7.1 Description

To determine a number of parameters related to the motor and the connected sensors (encoders/Hall sensors), an *auto setup* is performed. <u>Closed Loop</u> operation requires a successfully completed *auto setup*. *Auto setup* is only to be performed once during commissioning as long as the motor/sensor connected to the controller is not changed. For details, see <u>the corresponding section in chapter Commissioning</u>.

6.7.2 Activation

To activate the mode, the value "-2" (=" FE_h ") must be set in object <u>6060_h</u> (Modes Of Operation) (see <u>CiA 402</u> Power State Machine).

6.7.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

Bit 4 starts a travel command. This is carried out on a transition from "0" to "1".

6.7.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 10: Indexed: indicates whether (= "1") or not (= "0") an encoder index was found.
- Bit 12: Aligned: this bit is set to "1" after auto setup has concluded

7.1 Digital inputs and outputs

This controller is equipped with digital inputs and outputs.

7.1.1 Bit assignment

The software of the controller assigns each input and output two bits in the respective object (e.g., <u>60FDh</u> <u>Digital Inputs</u> or <u>60FEh Digital Outputs</u>):

- 1. The first bit corresponds to the special function of an output or input. These functions are always available on bits 0 to 15 (inclusive) of the respective object. These include the limit switches and the home switch for the digital inputs and the brake control for the outputs.
- 2. The second bit shows the output/input as a level; these are then available on bits 16 to 31.

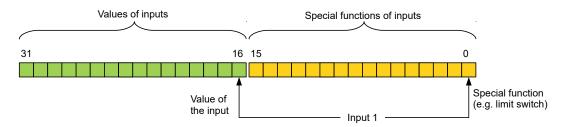

Example

To manipulate the value of output 2, always use bit 17 in 60FE_h.

To activate the "negative limit switch" special function of input 1, set bit 0 in $\underline{3240}_h:01_h$; to query the status of the input, read bit 0 in $\underline{60FD}_h$. Bit 16 in $\underline{60FD}_h$ also shows the status of input 1 (independent of whether or not the special function of the input was activated).

This assignment is graphically illustrated in the following drawing.

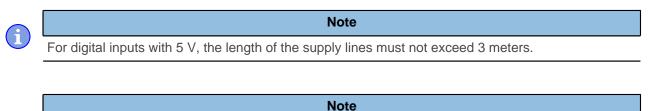

Bits of any object for controlling inputs

7.1.2 Digital inputs

7.1.2.1 Overview

i

The digital inputs are sampled once per millisecond. Signal changes at the input less than one millisecond in duration are not processed.

The following inputs are available:

	Input	Special function	Switching threshold switchable	Differential / single-ended
1		Negative limit switch	yes, 5 V or 24 V (see <u>3240_h:06_h)</u>	single-ended
2		Positive limit switch	yes, 5 V or 24 V (see <u>3240</u> _h :06 _h)	single-ended
3		Home switch	yes, 5 V or 24 V (see <u>3240</u> _h :06 _h)	single-ended
4		None	yes, 5 V or 24 V (see <u>3240</u> _h :06 _h)	single-ended
5		None	no, 5 V to 24 V wide range input	single-ended
6		None	no, 5 V to 24 V wide range input	single-ended

7.1.2.2 Object entries

The value of an input can be manipulated using the following OD settings, whereby only the corresponding bit acts on the input here.

<u>3240</u>_h:01_h (Special Function Enable): This bit allows special functions of an input to be switched off (value "0") or on (value "1"). If input 1 is not used as, e. g., a negative limit switch, the special function must be switched off to prevent an erroneous response to the signal generator. The object has no effect on bits 16 to 31.

The firmware evaluates the following bits:

- □ Bit 0: Negative limit switch (see Limitation of the range of motion)
- □ Bit 1: Positive limit switch (see Limitation of the range of motion)
- □ Bit 2: Home switch (see <u>Homing</u>)
- □ Bit 3: Interlock (see interlock function)

If, for example, two limit switches and one home switch are used, bits 0–2 in 3240_h:01_h must be set to "1".

<u>3240</u>_h:02_h (Function Inverted): This subindex switches from normally open logic (a logical high level at the input yields the value "1" in object <u>60FD</u>_h) to normally closed logic (the logical high level at the input yields the value "0").

This applies for the special functions (except for the clock and direction inputs) and for the normal inputs. If the bit has the value "0", normally open logic applies; for the value "1", normally closed logic applies. Bit 0 changes the logic of input 1, bit 1 changes the logic of input 2, etc.

<u>3240</u>_h:03_h (Force Enable): This subindex switches on the software simulation of input values if the corresponding bit is set to "1".
 In this case, the actual values are no longer used in object 3240, :04, but rather the set values for the set value

In this case, the actual values are no longer used in object 3240_h :04_h, but rather the set values for the respective input. Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.

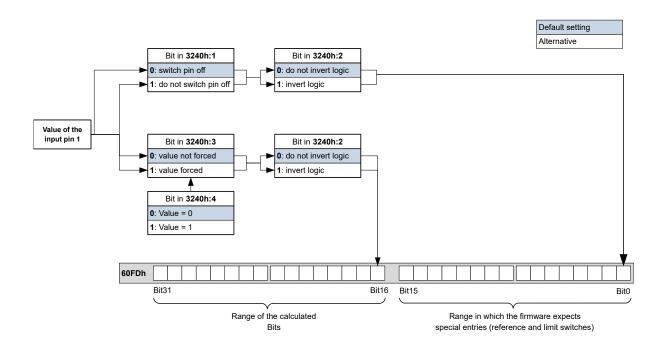

- <u>3240_h:04_h (Force Value): This bit specifies the value that is to be read as the input value if the same bit was set in object 3240_h:03_h.</u>
- **3240**_h: 05_h (Raw Value): This object contains the unmodified input value.
- <u>3240</u>_h:06_h (Input Range Select): This can be used to switch inputs that are equipped with this function from the switching threshold of 5 V (bit is "0") to the switching threshold of 24 V (bit is "1"). Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.
- <u>60FD_h</u> (Digital Inputs): This object contains a summary of the inputs and the special functions.

7.1.2.3 Computation of the inputs

Computation of the input signal using the example of input 1:

The value at bit 0 of object $\underline{60FD}_h$ is interpreted by the firmware as negative limit switch; the result of the complete computation is stored in bit 16.

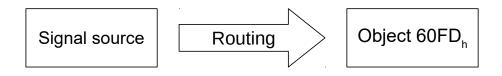

7.1.2.4 Input Routing

Principle

To perform the assignment of the inputs more flexibly, there is a mode called *Input Routing Mode*. This assigns a signal of a source to a bit in object $\underline{60FD}_{h}$.

Activation

This mode is activated by setting object <u>3240_h</u>:08_h (Routing Enable) to "1".

If *Input Routing* is switched on, the initial values of <u>3242</u>_h are changed and correspond to the function of the input as it was before activation of *Input Routing*. The inputs of the controller behave the same with activation of *Input Routing*. Therefore, you should not switch back and forth between the normal mode and *Input Routing*.

Note

Routing

Object 3242_h determines which signal source is routed to which bit of <u>60FD</u>_h. Subindex 01_h of 3242_h determines bit 0, subindex 02_h determines bit 1, and so forth. You can find the signal sources and their numbers in the following lists.

Number			
dec	hex	Signal source	
00	00	Signal is always 0	
01	01	Physical input 1	
02	02	Physical input 2	
03	03	Physical input 3	
04	04	Physical input 4	
05	05	Physical input 5

Number		
dec	hex	Signal source
143	8F	Inverted physical input 15
144	90	Inverted physical input 16
193	C1	Inverted Hall input "U"
194	C2	Inverted Hall input "V"
195	C3	Inverted Hall input "W"
196	C4	Inverted encoder input "A"
197	C5	Inverted encoder input "B"
198	C6	Inverted encoder input "Index"
200	C8	"Ethernet active" inverted status

Example

Input 1 is to be routed to bit 16 of object 60FD_h:

The number of the signal source for input 1 is "1". The routing for bit 16 is written in 3242_h :11_h.

Hence, object $3242_h:11_h$ must be set to the value "1".

7.1.2.5 Interlock function

The interlock function is a release that you control via bit 3 in $\underline{60FD}_h$. If this bit is set to "1", the motor can move. If the bit is set to "0", the controller switches to the error state and the action stored in $\underline{605E}_h$ is executed.

To activate the interlock function, you must switch on the special function by setting bit 3 in <u>3240</u>:01_h to "1".

Use *Input Routing* to define which signal source is routed to bit 3 of $\underline{60FD}_h$ and is to control the interlock function.

Example

Input 4 is to be routed to bit 3 of object $\underline{60FD}_h$ to control the interlock function. A low level is to result in an error state.

- 1. To activate Input Routing, set 3240_h:08_h to "1".
- 2. To route input 4 to bit 3, set 3242_h:04_h to "4".

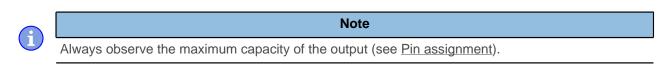

7.1.3 Digital outputs

7.1.3.1 Outputs

The outputs are controlled via object $\underline{60FE}_h$. Here, output 1 corresponds to bit 16 in object $\underline{60FE}_h$, output 2 corresponds to bit 17, etc., as with the inputs. The outputs with special functions are again entered in the firmware in the lower bits 0 to 15. The only bit assigned at the present time is bit 0, which controls the motor brake.

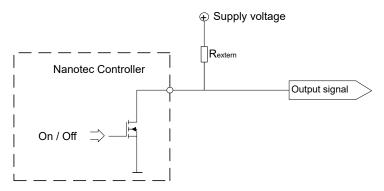

7.1.3.2 Wiring

The outputs are implemented as "open drain". Hence, an external voltage supply is always necessary.

Example

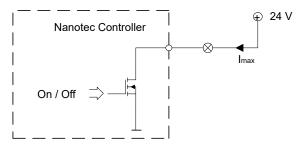

The digital output signal should continue to be used. For this purpose, a circuit as shown in the following figure is to be realized.

With a supply voltage of +24 V, a resistance value $R_{external}$ of 10 $k\Omega$ is recommended.

Example

A simple load is to be used with the digital output.

7.1.3.3 Object entries

Additional OD entries are available for manipulating the value of the outputs (see the following example for further information). As with the inputs, only the bit at the corresponding location acts on the respective output:

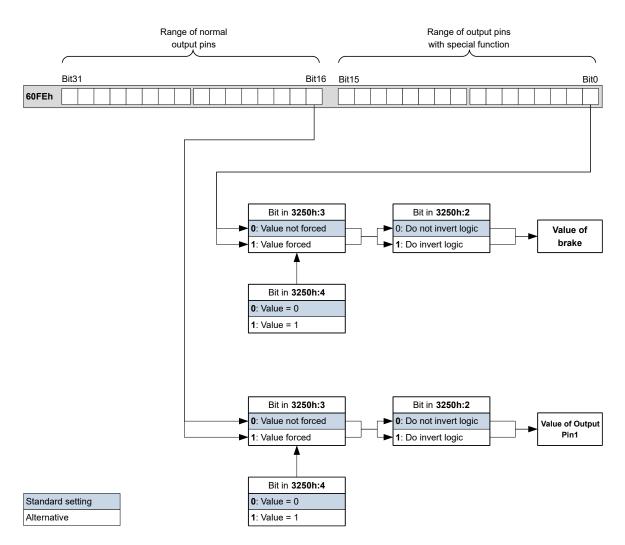

- $3250_h:01_h:$ No function.
- <u>3250</u>_h:02_h: This is used to switch the logic from normally open to normally closed. Configured as normally open, the output outputs a logical high level if the bit is "1". With the normally closed configuration, a logical low level is output accordingly for a "1" in object <u>60FE</u>_h.
- $3250_h:03_h:$ If a bit is set here, the output is controlled manually. The value for the output is then in object $3250_h:4_h$; this is also possible for the brake output.
- <u>3250_h:04_h: The bits in this object specify the output value that is to be applied at the output if manual control of the output is activated by means of object <u>3250_h:03_h</u>.</u>

- $3250_h:05_h:$ The bit combination applied to the outputs is stored in this subindex.
- <u>3250_h:08_h: For activating the Output Routing</u>.
- <u>3250</u>_h:09_h: For switching control of the <u>Power LED</u> on/off. If bit 0 is set to "1", the green LED is activated (flashes in normal operation). If bit 1 is set to "1", the red LED is activated (flashes in case of an error). If the bit is set to "0", the respective LED remains off.

7.1.3.4 Computation of the outputs

Example for calculating the bits of the outputs:

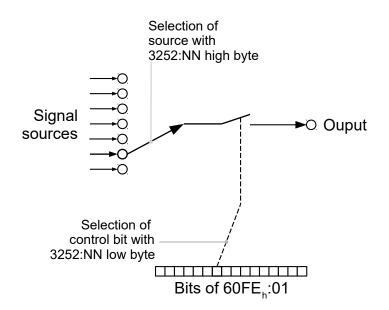

7.1.3.5 Output Routing

Principle

The "Output Routing Mode" assigns an output a signal source; a control bit in object $\underline{60FE}_h:01_h$ switches the signal on or off.

The source is selected with 3252_h :01 to 05 in the "high byte" (bit 15 to bit 8). The assignment of a control bit from object $60FE_h$:01_h is performed in the "low byte" (bit 7 to bit 0) of 3252_h :01_h to 05 (see following figure).

Activation

This mode is activated by setting object $3250_h:08_h$ (Routing Enable) to "1".

Routing

The subindex of object 3252_h determines which signal source is routed to which output. The output assignments are listed in the following:

Subindex 3252 _h	Output Pin
01 _h	Configuration of the PWM output (software PWM)
02 _h	Configuration of output 1
03 _h	Configuration of output 2 (if available)
0n _h	Configuration of output n (if available)

The maximum output frequency of the PWM output (software PWM) is 2 kHz. All other outputs can only produce signals up to 500 Hz.

Note

Subindices $3252_h:01_h$ to $0n_h$ are 16 bits wide, whereby the high byte selects the signal source (e. g., the PWM generator) and the low byte determines the control bit in object $60FE_h:01$.

Bit 7 of $3252_h:01_h$ to $0n_h$ inverts the controller from object $60FE_h:01$. Normally, value "1" in object $60FE_h:01_h$ switches on the signal; if bit 7 is set, the value "0" switches on the signal.

Number in 3252:01 to 0n

 $00XX_{h}$

Output is always "1"

Number in 3252:01 to 0n	
01XX _h	Output is always "0"
02XX _h	Encoder signal (6063 _h) with frequency divider 1
03XX _h	Encoder signal (6063 _h) with frequency divider 2
04XX _h	Encoder signal (6063 _h) with frequency divider 4
05XX _h	Encoder signal (6063 _h) with frequency divider 8
06XX _h	Encoder signal (6063 _h) with frequency divider 16
07XX _h	Encoder signal (6063 _h) with frequency divider 32
08XX _h	Encoder signal (6063 _h) with frequency divider 64
09XX _h	Position Actual Value (6064_{h}) with frequency divider 1
0AXX _h	Position Actual Value (6064_{h}) with frequency divider 2
0BXX _h	Position Actual Value (6064_{h}) with frequency divider 4
0CXX _h	Position Actual Value (6064_{h}) with frequency divider 8
0DXX _h	Position Actual Value (6064_{h}) with frequency divider 16
0EXX _h	Position Actual Value (6064_{h}) with frequency divider 32
0FXX _h	Position Actual Value (6064 _h) with frequency divider 64
10XX _h	PWM signal that is configured with object $\underline{2038}_{h}$:05 _h and 06 _h
11XX _h	Inverted PWM signal that is configured with object $\underline{2038}_{h}{:}05_{h}$ and 06_{h}

Note

On any change of the "encoder signal" ($\underline{6063}_h$) or the current position ($\underline{6064}_h$ in <u>user-defined units</u>) by an increment, a pulse is output at the digital input (for frequency divider 1). Take this into account when selecting the frequency divider and the unit, especially when using sensors with low resolution (such as Hall sensors).

Example

The encoder signal $(\underline{6063}_h)$ is to be applied to output 1 with a frequency divider 4. The output is to be controlled with bit 5 of object <u>60FE</u>:01.

- $3250_h:08_h = 1$ (activate routing)
- $3252_h:02_h = 0405_h (04XX_h + 0005_h)$
- 04XX_h: Encoder signal with frequency divider 4
- 0005_h: Selection of bit 5 of <u>60FE</u>:01

The output is switched on by setting bit 5 in object 60FE:01.

Example

The brake PWM signal is to be applied to output 2. Because the automatic brake control uses bit 0 of $\underline{60FE}$:01_h, this should be used as control bit.

- $3250_h:08_h = 1$ (activate routing)
- $3252_h:03_h = 1080_h (=10XX_h + 0080_h)$. Where:
 - □ 10XX_h: Brake PWM signal
 - 0080_h: Selection of the inverted bit 0 of object <u>60FE</u>:01

7.2 Analog inputs

The controller has 2 analog inputs with 10-bit resolution. They are located on pins 8 and 9 of $\underline{X3}$. You can configure both analog inputs as a current input or as a voltage input with <u>object 3221_h</u>.

You can read out the analog value in a <u>NanoJ program</u> and use it as you like, e. g., to specify the target speed.

7.2.1 Object entries

To read out and, if necessary, manipulate the value of the analog input, use the following OD settings:

- <u>3220_h</u> (Analog Inputs): This object displays the instantaneous values of the analog inputs in ADC digits.
- <u>3221_h</u>: (Analogue Inputs Control): With this object, you can switch the analog input from voltage measurement to current measurement.
- <u>3320</u>_h (Read Analogue Input): This object displays the instantaneous values of the analog inputs in user-defined units.
- <u>3321_h</u>(Analogue Input Offset): This is the offset that is added to the read analog value (<u>3220_h</u>) before scaling (multiplier from object <u>3322_h</u> and divisor from object <u>3323_h</u>).
- <u>3322_h(Analogue Input Factor Numerator)</u>: This is the value by which the read analog value (<u>3220_h</u> + <u>3321</u>) is multiplied before it is written in object <u>3320_h</u>.
- <u>3323_h(Analogue Input Factor Denominator)</u>:

This is the value by which the read analog value $(3220_{h} + 3321_{h})$ is divided before it is written in object 3320_{h} .

7.2.2 Scale analog value

You read the value in object $\underline{3320_h}$ (Read Analogue Input): This object displays the instantaneous values of the analog inputs in user-defined units.

The user-defined units are made up of offset (3321_{h}) and scaling value $(3322_{h}/3323_{h})$. If both are still set to the default values, the value in 3320_{h} is specified in the *ADC Digits* unit.

Example

Analog input 1 has a measuring range of -10 V...+10 V. There is a voltage of 0 V...+10 V on the analog input, which, at a resolution of 10 bits, corresponds to the value range 512...1023 *ADC digits*.

To display the analog value in the physical unit of millivolt, proceed as follows:

- **1.** Write the value "-511" in $3321_h:01_h$ (Analogue Input Offset).
- Write the value "20000" (corresponds to the entire measurement range in millivolt) in 3322_h:01_h (Analogue Input Factor Numerator).
- **3.** Write the value "1024" (corresponds to the resolution) in 3323_h:01_h (Analogue Input Factor Denominator).

At the maximum voltage of 10 V, now read out the value "10000" in object 3320_{hh} (Read Analogue Input):

(1023 digits - 511 digits) * 20000 mV / 1024 = 10000 mV

7.3 Automatic brake control

7.3.1 Description

Automatic brake control is activated if the controller is switched to the *Operation enabled* state of the <u>CiA 402</u> <u>Power State Machine</u>; the brake otherwise always remains closed.

The brake output of the controller results in a PWM signal that can be adjusted with respect to frequency and duty cycle.

For information on the interaction of the brake with the motor stopping behavior, see also chapter <u>Power</u> <u>State machine – halt motion reactions</u>.

7.3.2 Activation and connection

The brake can be controlled either automatically or manually:

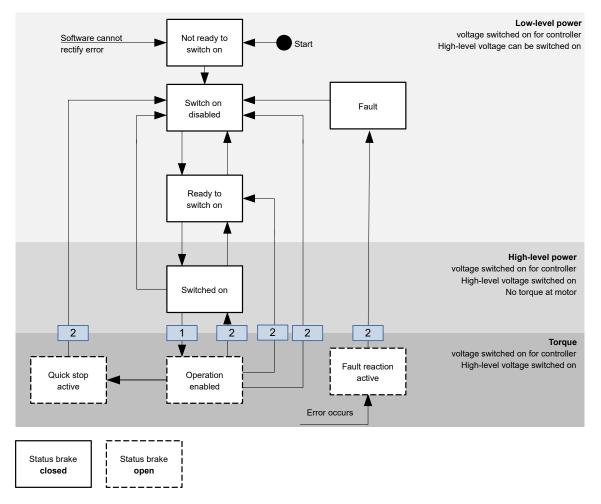

- Automatic: Setting bit 2 of object <u>3202_h</u> to "1" activates the brake control.
- Manual: Setting bit 2 of object <u>3202_h</u> to "0" deactivates the brake control; the brake can now be controlled with bit 0 in object <u>60FE_h</u>:01_h.

7.3.2.1 Connection

The brake output is located on connector X4 (see chapter X4 – brake connection)

7.3.3 Brake control

The following graphic shows the states of the <u>CiA 402 Power State Machine</u> together with the states of the brake for the automatic mode.

The following steps are performed on the transition, which is marked with 1:

- 1. The motor current is switched on.
- **2.** The time stored in 2038_h : 3_h is allowed to elapse.
- 3. The brake releases.
- **4.** The time stored in 2038_h :4_h is allowed to elapse.
- 5. The Operation enabled state is reached, the motor controller can perform travel commands.

The following steps are performed on all transitions that are marked with 2:

- 1. The motor is brought to a standstill.
- **2.** The time stored in 2038_h :1_h is allowed to elapse.
- 3. The brake is activated.
- **4.** The time stored in 2038_h : 2_h is allowed to elapse.
- 5. The motor current is switched off.

7.3.4 Brake PWM

The switched-on brake generates a PWM signal at the output of the controller that can be adjusted with respect to duty cycle and frequency. If an output pin without PWM is needed, a duty cycle of 100 percent can be set.

Note

The Brake + pin of the brake output is internally connected to the voltage supply of the controller.

If the operating voltage of the brake is greater than the supply voltage of the controller, you cannot use the brake output of the controller; you must supply the brake externally.

If the supply voltage of the controller is greater than the operating voltage of the brake (and up to 48 V DC), it is recommended that the PWM controller from Nanotec with order designation EB-BRAKE-48V be used and the duty cycle of the controller brake output be set to "100".

Note

7.3.4.1 Frequency

The frequency of the brake PWM can be set in object 2038_{h} :5_h. The unit is Hertz; a value greater than 2000 is not possible.

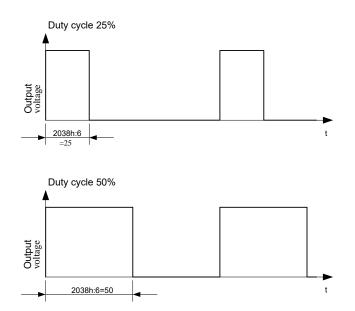

7.3.4.2 Duty cycle

The duty cycle – the ratio of pulse to period duration – is set in 2038_b:6_b. The value is a percentage and can be selected between 2 and 100. With a value of 100, the output pin is permanently switched on.

In the following figure, example duty cycles of 25 and 50 percent are shown, whereby the frequency is held constant.

7.4 I²t Motor overload protection

7.4.1 Description

Note For stepper motors, only the rated current is specified, not a maximum current. No liability is therefore assumed when using l^2t with stepper motors.

The goal of I²t motor overload protection is to protect the motor from damage and, at the same time, operate it normally up to its thermal limit.

This function is only available if the controller is in the <u>closed loop mode</u> (bit 0 of object 3202_h must be set to "1").

7.4.2 Object entries

The following objects affect I²t motor overload protection:

- <u>2031_h</u>: Max Motor Current specifies the maximum permissible motor current in mA.
- <u>203B</u>_h:1_h Motor Rated Current specifies the rated current in mA.
- <u>6073</u>_h Max Current specifies the maximum current in tenths of a percent of the set rated current.
- <u>203B</u>_h:2_h Maximum Duration Of Peak Current specifies the maximum duration of the maximum current in ms.

The following objects indicate the current state of I²t:

- <u>203B_h:3_h</u> Threshold specifies the limit in mAs that determines whether the maximum current or rated current is switched to.
- <u>203B</u>_h:4_h CalcValue specifies the calculated value that is compared with the threshold for setting the current.
- $203B_h:5_h$ LimitedCurrent shows the momentary current value that was set by I^2t .
- <u>203B</u>_h:6_h Status:
 - \Box Value = "0": I²t deactivated
 - \Box Value = "1": I²t activated

7.4.3 Activation

Closed loop must be activated, (bit 0 of object <u>3202</u>_h set to "1", see also chapter <u>Closed Loop</u>).

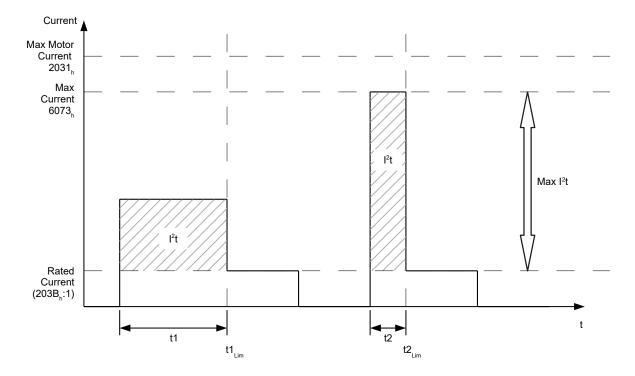

To activate the mode, you must appropriately specify the four object entries mentioned above $(2031_h, 6073_h, 203B_h:1_h, 203B_h:2_h)$. This means that the maximum current must be greater than the rated current and a time value for the maximum duration of the maximum current must be entered. If these conditions are not met, the l²t functionality remains deactivated.

7.4.4 Function of I²t

From the specification of rated current, maximum current and maximum duration of the maximum current, an $I^2 t_{Lim}$ is calculated.

The motor can run with maximum current until the calculated $I^2 t_{Lim}$ is reached. The current is then immediately reduced to the rated current. The maximum current is limited by the maximum motor current (2031_h).

The relationships are illustrated again in the following diagrams.

In the first section, t1, the current value is higher than the rated current. At time $t1_{Lim}$, I^2t_{Lim} is reached and the current is limited to the rated current. A current that corresponds to the maximum current then occurs for a period of time t2. Hence, the value for I^2t_{Lim} is reached more quickly than in time t1.

7.5 Saving objects

Note

Improper use of the function can result in it no longer being possible to start the controller. Therefore, carefully read the entire chapter before using the function.

7.5.1 General

i

Many objects in the object dictionary can be saved and then automatically reloaded the next time the controller is switched on or reset. Furthermore, the saved values are also retained following a firmware update.

Only entire collections of objects (referred to in the following as *categories*) can be saved together; individual objects cannot be saved.

An object can be assigned one of the following categories:

- Communication: Parameters related to external interfaces, such as PDO configuration etc.
- Application: Parameters related to operating modes.
- Customer: Parameters that are written and read by the customer/user only and are ignored by the controller firmware.
- Drive: Parameters related to the motor and the sensors (BLDC/Stepper, *closed/open loop…*). Some are set and saved by auto setup.
- Tuning: Parameters related to motor and encoder that are set either by auto setup or that can be found in the data sheets, e.g., pole pairs and maximum current.
- Ethernet: Parameters related to Ethernet communication

If an object is not assigned one of these *categories*, it cannot be saved, e.g., statusword and all objects whose value is dependent on the current state of the controller.

The objects in each *category* are listed below. In chapter <u>Description of the object dictionary</u>, the corresponding *category* for each object is also specified.

7.5.2 Category: communication

- <u>2102</u>_h: Fieldbus Module Control
- <u>3501_h: EtherNetIP Rx PDO Mapping</u>
- <u>3601</u>_h: EtherNetIP Tx PDO Mapping

7.5.3 Category: application

- <u>2034</u>_h: Upper Voltage Warning Level
- <u>2035</u>_h: Lower Voltage Warning Level

7.5.7 Category: Ethernet

- <u>2010</u>_h: IP-Configuration
- <u>2011</u>: Static-IPv4-Address
- <u>2012</u>_h: Static-IPv4-Subnet-Mask
- <u>2013</u>_h: Static-IPv4-Gateway-Address

7.5.8 Starting the save process

CAUTION

Uncontrolled motor movements!

Control may be affected while saving. Unforeseen reactions can result.

► The motor must be at a standstill before starting the saving process. The motor must not be started while saving.

T

- Note
- Saving may take a few seconds. Under no circumstances may you interrupt the voltage supply while saving. The state of the saved objects is otherwise undefined.
- Always wait until the controller has signaled that the save process has been successfully completed with the value "1" in the corresponding subindex in object <u>1010_h</u>.

There is a subindex in object 1010_h for each *category*. To save all objects of this *category*, the value "65766173_h" must be written in the subindex. ¹ The controller signals the end of the save process by overwriting the value with a "1".

The following table shows which subindex of object 1010_{h} is responsible for which *category*.

Subindex	Category
01 _h	All categories with the exception of 0C _h (Ethernet)
02 _h	Communication
03 _h	Application
04 _h	Customer
05 _h	Drive
06 _h	Tuning
0C _h	Ethernet

7.5.9 Discarding the saved data

If all objects or one *category* of saved objects is to be deleted, value "64616F6C_h" must be written in object 1011_{h} .² The following subindices correspond to a *category* here:

Subindex	Category
01 _h	All categories (reset to factory settings) with the exception of 06_h (Tuning) and $0C_h$ (Ethernet)
02 _h	Communication
03 _h	Application
04 _h	Customer
05 _h	Drive
06 _h	Tuning
0C _h	Ethernet

The saved objects are subsequently discarded; the change does not take effect until after the controller is restarted. You can restart the controller by entering the value "746F6F62_h" in 2800_{h} :01_h.

Note

- Objects of *category* 06_h (Tuning) are determined by <u>Auto setup</u> and are not reset when resetting to factory settings with subindex 01_h (thereby making it unnecessary to again perform an auto setup). You can reset these objects with subindex 06_h.
- Objects of *category* 0C_h (Ethernet) are not reset with subindex 01_h.

¹ This corresponds to the decimal of 1702257011_d or the ASCII string save.

Ť

² This corresponds to the decimal of 1684107116_d or the ASCII string load.

7.5.10 Verifying the configuration

Object 1020_h can be used to verify the configuration. It acts as a modification marker similar to common text editors: as soon as a file is modified in the editor, a marker (usually an asterisk) is added.

The entries of object $\frac{1020_{h}}{1010_{h}}$ can be written with a date and time and then saved together with all other savable objects with $\frac{1010_{h}}{1010_{h}}$:01.

The entries of $\underline{1020}_h$ are reset to "0" as soon as a savable object (including $\underline{1010}_h$:0x_h, except for $\underline{1010}_h$:01_h and $\underline{1020}_h$) is written.

The following sequence makes verification possible:

- 1. An external tool or master configures the controller.
- **2.** The tool or master sets the value in object $1020_{\rm h}$.
- **3.** The tool or master activates the saving of all objects $1010_h:01_h = 65766173_h$. The date and time in object 1020_h are also saved.

After the controller is restarted, the master can check the value in $\underline{1020}_{h}:01_{h}$ and $\underline{1020}:01_{h}$. If one of the values is "0", the object dictionary was changed after the saved values were loaded. If the date or time in $\underline{1020}$ does not correspond to the expected value, objects were probably saved with values other than those that were expected.

8 EtherNet/IP[™]

With EtherNet/IP[™], it is possible to use the most important CiA402 operating modes of the controller. The use of the cyclical modes described in the CiA402 standard (interpolated position mode, cyclic synchronous torque, velocity and position) is not currently possible.

The following message types are supported:

- CIP[™] messages (CIP UCMM, CIP class 3 and others)
- I/O data transfer (CIP class 1)

EtherNet/IP[™] references: <u>www.odva.org</u>.

- THE CIP NETWORKS LIBRARY Volume 1: Common Industrial Protocol (CIP), Date: April.2014, Edition: 3.16
- THE CIP NETWORKS LIBRARY Volume 2: EtherNet/IP Adaptation of CIP, Date: April.2015, Edition: 1.19
- Network Infrastructure for EtherNet/IP[™]: Introduction and Considerations

Note

Nanotec controllers are always based on CANopen standard CiA402. All attributes are therefore stored in a so-called *object dictionary*. These can be addressed with an index and a subindex, such as $1018_{\rm h}$:01_h. The index is a 16-bit value and the subindex is an 8-bit value.

The controller offers EtherNet/IP[™], but this protocol uses a different procedure: all attributes are stored on the basis of objects. For this reason, the controller uses an assignment to create a bridge between EtherNet/IP[™] and CANopen. As a consequence, the configuration of this controller is somewhat different that with normal EtherNet/IP[™] devices.

8.1 Device profile

i

The Nanotec EtherNet/IP[™] implementation contains a manufacturer-specific device profile for accessing manufacturer-specific controller properties and motor control.

With the following three services, it is possible to access each attribute for reading or writing. Each attribute listed in chapter <u>Description of the object dictionary</u> can be accessed.

Name	Service	Class	Instance	Attribute
Get object dictionary entry	0x32	0x64	1	0
Set object dictionary entry	0x33	0x64	1	0
Get object dictionary entry Rockwell	0x34	0x64	1	0

In addition to the manufacturer-specific profile, the following standard services are also offered:

- Message Router Object
- Connection Manager
- Connection Configuration
- Port
- Ethernet Link Object
- TCP/IP Object
- Assembly

8.2 Service: Get object dictionary entry

The following table shows the assignment of the data for reading an attribute. The length of the data is dependent on the attribute.

Name	Service	Class	Instance	Attribute	Data
GetOD entry	0x32	0x64	1	0	Index (16-bit) Subindex (8- Bit)

8.3 Service: Set object dictionary entry

The following table shows the assignment of the data for writing a value in an attribute. The length of the data is dependent on the attribute. It is at least 1 byte and no more than 4 bytes long.

Name	Service	Class	Instance	Attribute		Data	1
SetOD entry	0x33	0x64	1	0	Index (16- bit)	Subindex (8-Bit)	Value

8.4 Service: Get object dictionary entry Rockwell

The following table shows the assignment of the data for reading an attribute. The response contains a 16bit object type, a 16-bit data length and the data. The response to this is: Object type (16-bit), followed by the data length (16-bit) and the data itself.

Name	Service	Class	Instance	Attribute	Data
GetOD entry	0x34	0x64	1	0	Index (16-bit) Subindex (8- Bit)

8.5 Assembly objects

There is a set of producer/consumer groups (*I/O Common*) that contain the following:

- Objects for operating the Plug & Drive interface which enable you
 - □ to use the supported operating modes,
 - □ to monitor the state of the controller
 - □ and to access the objects of the object dictionary.

You can find additional information on the *Plug* & *Drive interface* in document *Function description Plug* & *Drive interface* on <u>us.nanotec.com</u>.

- <u>NanoJ inputs and outputs</u>. They are used to pass values to the *NanoJ program* and to read out values.
- Inputs and outputs
- Current actual values such as position, speed, torque, following errors
- the error code of the last error that occurred

An additional set (*I/O PDI*) contains only the input and output objects for the *Plug & Drive interface* (PDI), see <u>PDI assemblies</u>.

Note

It is not possible to use the *I/O Common* assembly set and <u>PDI assemblies</u> (*I/O PDI*) simultaneously. Select only one *connection*; either *I/O Common* or *I/O PDI*.

8.6 Configuring the assembly objects

The assembly objects in the controller are static and do not support dynamic assemblies. The size of the static assemblies is always 128 bytes. The most important data for the various operating modes are already configured; it is, however, possible to append additional data.

The mapped data can only be changed with the *SetOD entry* command. If changing the configuration, note that the EDS file must also be adapted. It is recommended that the new data be appended to the end of the current mapping. As listed in chapter <u>Assembly objects</u>, there is a data range provided for future use.

The data are organized successively without gaps. If an 8-bit data value is to have, e.g., 32-bit alignment, it is possible to use so-called *dummy objects*. Use can also be viewed in the standard configuration for objects 3501_h and 3601_h .

To be able to change the mapping, you must first deactivate it by setting the corresponding subindex $0_{\rm h}$ to "0".

Note

After writing the objects to the respective subindices, enter the number of mapped objects in subindex $0_{\rm h}.$

The following table lists all available *dummy objects*:

Index	Data type
0002 _h	Signed integer (8 bit)
0003 _h	Signed integer (16 bit)
0004 _h	Signed integer (32 bit)
0005 _h	Unsigned integer (8 bit)
0006 _h	Unsigned integer (16 bit)
0007 _h	Unsigned integer (32 bit)

8.7 Rockwell Studio 5000

8.7.1 Restrictions

The controller operates with all possible data formats; it can handle the data formats in the following list.

	Abbreviation							
Size in bytes	Signed	Unsigned						
8	SINT	USINT						
16	INT	UINT						
32	DINT	UDINT						

Rockwell PLCs only support signed number formats. Thus, all attributes are converted to a DINT (32 byte, signed). This can cause problems when converting an unsigned 32-bit integer to one with a sign if the highest bit is set. In this case, the number becomes a negative – instead of a positive – number. Currently, such UDINT attributes – which may likely have the highest bit set – are usually a status and it is possible to reference the individual bits with a BOOL type.

G

8.8 Panasonic PLC

Note

Connection problems when importing the EDS file in the case of the Panasonic PLC. The Panasonic PLC does not support the "ZERO" connection type.

▶ Before importing, remove the "ZERO" connection type from the EDS file.

9 Programming with NanoJ

NanoJ is a programming language similar to *C* or *C*++. NanoJ is integrated in the *Plug* & *Drive Studio* software. You can find further information in document *Plug* & *Drive Studio: Quick Start Guide* at <u>us.nanotec.com</u>.

9.1 NanoJ program

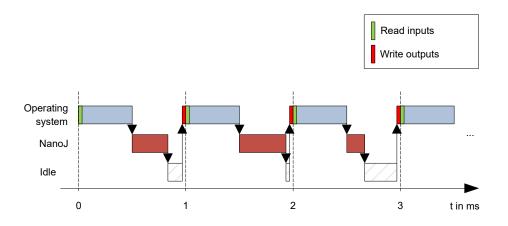

A *NanoJ program* makes a protected runtime environment available within the firmware. Here, the user can create his own processes. These can then trigger functions in the controller by, for example, reading or writing entries in the object dictionary.

Through the use of protective mechanisms, a *NanoJ program* is prevented from crashing the firmware. In the worst case, the execution is interrupted with an error code stored in the object dictionary.

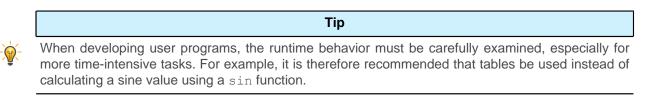

If the *NanoJ program* was loaded on the controller, it is automatically executed after the controller is switched on or restarted, as long as you do not set bit 0 in object <u>2300_h</u> to "0".

9.1.1 Available computing time

A *NanoJ program* receives computing time cyclically in a 1 ms clock (see following figure). Because computing time is lost through interrupts and system functions of the firmware, only approx. 30% – 50% of computing time is available to the user program (depending on control mode and application). In this time, the user program must run through the cycle and either complete the cycle or yield the computing time by calling the <code>yield()</code> function. In the former case, the user program is restarted with the start of the next 1 ms cycle; the latter results in the program being continued on the next 1 ms cycle with the command that follows the <code>yield()</code> function.

If the *NanoJ program* needs more time than was allotted, it is ended and an error code set in the object dictionary.

1

Note

If the NanoJ program does not yield the computing time after too long a time, it is ended by the operating system. In this case, the number 4 is entered in the statusword for object 2301_h ; in the error register for object 2302_h , the number 5 (timeout) is noted, see <u>2301h NanoJ Status</u> and <u>2302h NanoJ Error Code</u>.

To keep the *NanoJ program* from stopping, you can activate *AutoYield* mode by writing value "5" in $2300_{\rm h}$. In *AutoYield* mode, however, the *NanoJ program* is no longer real-time capable and no longer runs every 1 ms.

9.1.2 Protected runtime environment

Using process-specific properties, a so-called *protected runtime environment* is generated. A user program in the protected runtime environment is only able to access specially allocated memory areas and system resources. For example, an attempt to directly write to a processor IO register is acknowledged with an *MPU Fault* and the user program terminated with the corresponding error code in the object dictionary.

9.1.3 NanoJ program – communication possibilities

A NanoJ program has a number of possibilities for communicating with the controller:

- Read and write OD values using PDO mapping
- Directly read and write OD values via NanoJ functions
- Call other NanoJ functions (e.g., write <u>debug output</u>)

The OD values of the user program are made available in the form of variables via *PDO mapping*. Before a user program receives the 1 ms time slot, the firmware transfers the values from the object dictionary to the variables of the user program. As soon as the user program receives computing time, it can manipulate these variables as regular C variables. At the end of the time slot, the new values are then automatically copied by the firmware back to the respective OD entries.

To optimize the performance, three types of mapping are defined: input, output, and input/output (In, Out, InOut).

- *Input mappings* can only be read; they are not transferred back to the object dictionary.
- Output mappings can only be written.
- Input/output mappings, on the other hand, can both be read and written.

The set mappings can be read and checked via the GUI for objects 2310_h , 2320_h , and 2330_h . Up to 16 entries are allowed for each mapping.

Whether a variable is stored in the input, output or data range is controlled in *Plug & Drive Studio* via the specification of the *linker section*.

NanoJ inputs and NanoJ outputs

To communicate with the NanoJ program via the respective interface, you can use the following objects:

- 2400h NanoJ Inputs: Array with thirty-two S32 values for passing values to the NanoJ program
- 2410h NanoJ Init Parameters: Array with thirty-two S32 values. This object can be stored, unlike 2400h.
- <u>2500h NanoJ Outputs</u>: Array with thirty-two S32 values, where the NanoJ program can store values that can be read out via the fieldbus

9.1.4 Executing a NanoJ program

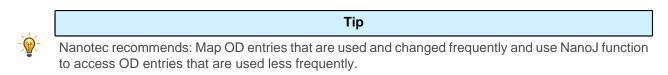

When executing a cycle, the *NanoJ program* essentially consists of the following three steps with respect to the PDO mapping:

- 1. Read values from the object dictionary and copy them to the input and output areas
- 2. Execute a user program
- 3. Copy values from the output and input areas back to the object dictionary

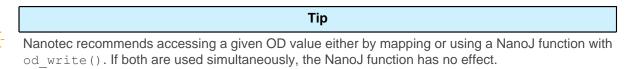

The configuration of the copy processes is based on the CANopen standard.

In addition, values of the object dictionary can be accessed via NanoJ functions. This is generally slower; mappings are therefore to be preferred. The number of mappings is limited (16 entries each in In/Out/InOut).

A list of available NanoJ functions can be found in chapter NanoJ functions in the NanoJ program.

9.1.5 NanoJ program – OD entries

The NanoJ program is controlled and configured in object range 2300_h to 2330_h (see 2300h NanoJ Control).

	OD-Index	Name and description						
2300 _h		2300h NanoJ Control						
2301 _h		2301h NanoJ Status						
2302 _h		2302h NanoJ Error Code						
2310 _h		2310h NanoJ Input Data Selection						
2320 _h		2320h NanoJ Output Data Selection						
2330 _h		2330h NanoJ In/output Data Selection						

Example:

To start the TEST1.USR user program, the following sequence can, for example, be used:

- Check entry <u>2302</u>_h for error code.
- If no error:

Start the NanoJ program by writing object $2300_{\rm h}$, bit 0 = "1" or by restarting the controller.

Note

It can take up to 200 ms for the NanoJ program to start.

• Check entry 2302_h for error code and object 2301_h , bit 0 = "1".

To stop a running program: write entry 2300_h with bit 0 value = "0".

9.1.6 Structure of a NanoJ program

A user program consists of at least two instructions:

- the preprocessor instruction #include "wrapper.h"
- the void user() { } function

The code to be executed can be stored in the ${\tt void}$ ${\tt user()}$ function.

Note

The file names of the user programs must not be longer than eight characters plus three characters in the suffix; file name main.cpp is permissible, file name aLongFileName.cpp is not permissible.

Note

In NanoJ programs, global variables may only be initialized within functions. It then follows:

- No new operator
- No constructors
- No initialization of global variables outside of functions

Examples:

Ť

The global variable is to be initialized within the void user() function:

```
unsigned int i;
void user(){
    i = 1;
    i += 1;
}
```

The following assignment is not correct:

```
unsigned int i = 1;
void user() {
  i += 1;
}
```

9.1.7 NanoJ program example

The example shows the programming of a square wave signal in object 2500_h:01_h.

```
// file main.cpp
map S32 outputReg1 as inout 0x2500:1
#include "wrapper.h"
// user program
void user()
  U16 counter = 0;
  while(1)
  {
    ++counter;
    if ( counter < 100 )
    InOut.outputReg1 = 0;
    else if ( counter < 200 )
     InOut.outputReg1 = 1;
    else
     counter = 0;
    // yield() 5 times (delay 5ms)
    for(U08 i = 0; i < 5; ++i)
      yield();
  }
}// eof
```

You can find other examples at us.nanotec.com.

9.2 Mapping in the NanoJ program

With this method, a variable in the *NanoJ program* is linked directly with an entry in the object dictionary. The creation of the mapping must be located at the start of the file here, even before the #include "wrapper.h" instruction.

Nanotec recommends:

Use mapping if you need to access an object in the object dictionary frequently, e.g., controlword 6040_h or statusword 6041_h.

Tip

The od_write() and od_read() functions are better suited for accessing objects a single time, see <u>Accessing the object dictionary</u>.

9.2.1 Declaration of the mapping

The declaration of the mapping is structured as follows:

map <TYPE> <NAME> as <input|output|inout> <INDEX>:<SUBINDEX>

Where:

<TYPE>

The data type of the variable; U32, U16, U08, S32, S16 or S08.

NAME>

The name of the variable as it is used in the user program.

<input|output|inout>

The read and write permission of a variable: a variable can be declared as an input, output or inout. This defines whether a variable is readable (input), writable (output) or both (inout) and the structure by means of which it must be addressed in the program.

<INDEX>:<SUBINDEX>

Index and subindex of the object to be mapped in the object dictionary.

Each declared variable is addressed in the user program via one of the three structures: *In*, *Out* or *InOut* depending on the defined write and read direction.

Note

A comment is only permitted above the respective mapping declaration in the code, not on the same line.

9.2.2 Example of mapping

Example of a mapping and the corresponding variable accesses:

```
// 6040_h:00_h is UNSIGNED16
map U16 controlWord as output 0x6040:00
// 6041_h:00_h is UNSIGNED16
map U16 statusWord as input 0x6041:00
// 6060_h:00_h is SIGNED08 (INTEGER8)
map S08 modeOfOperation as inout 0x6060:00
```

```
#include "wrapper.h"
void user()
{
   [...]
   Out.controlWord = 1;
   U16 tmpVar = In.statusword;
   InOut.modeOfOperation = tmpVar;
   [...]
}
```

9.2.3 Possible error at od_write()

A possible source of errors is a write access with the od_write() function (see <u>NanoJ functions in the</u> <u>NanoJ program</u>) of an object in the object dictionary that was simultaneously created as mapping. The code listed in the following is incorrect:

```
map U16 controlWord as output 0x6040:00
#include " wrapper.h"
void user()
{
   [...]
   Out.controlWord = 1;
   [...]
   od_write(0x6040, 0x00, 5); // der Wert wird durch das Mapping überschrieben
   [...]
}
```

The line with the $od_write(0x6040, 0x00, 5)$; command has no effect. As described in the introduction, all mappings are copied to the object dictionary at the end of each millisecond.

This results in the following sequence:

- **1.** The od write function writes the value 5 in object $6040_h:00_h$.
- **2.** At the end of the 1 ms cycle, the mapping is written that also specifies object $6040_h:00_h$, however, with the value 1.
- 3. From the perspective of the user, the od write command thus serves no purpose.

9.3 NanoJ functions in the NanoJ program

With NanoJ functions, it is possible to call up functions integrated in the firmware directly from a user program. Code can only be directly executed in the protected area of the protected execution environment and is realized via so-called *Cortex Supervisor Calls* (Svc Calls). Here, an interrupt is triggered when the function is called, thereby giving the firmware the possibility to temporarily permit code execution outside of the protected execution environment. Developers of user programs do not need to worry about this mechanism – for them, the NanoJ functions can be called up like normal C functions. Only the *wrapper.h* file needs to be integrated as usual.

9.3.1 Accessing the object dictionary

void od_write (U32 index, U32 subindex, U32 value)

This function writes the transferred value to the specified location in the object dictionary.

index	Index of the object to be written in the object dictionary
subindex	Subindex of the object to be written in the object dictionary
value	Value to be written

Note

It is highly recommended that the processor time be passed on with <code>yield()</code> after calling a <code>od_write()</code>. The value is immediately written to the OD. For the firmware to be able to trigger actions that are dependent on this, however, it must receive computing time. This, in turn, means that the user program must either be ended or interrupted with <code>yield()</code>.

U32 od_read (U32 index, U32 subindex)

This function reads the value at the specified location in the object dictionary and returns it.

index	Index of the object to be read in the object dictionary
subindex	Subindex of the object to be read in the object dictionary
Output value	Content of the OD entry

i

Note
Active waiting for a value in the object dictionary should always be associated with a yield().

Example

```
while (od_read(2400,2) != 0) // wait until 2400:2 is set
{ yield(); }
```

9.3.2 Process control

void yield()

This function returns the processor time to the operating system. In the next time slot, the program continues at the location after the call.

void **sleep** (U32 ms)

This function returns the processor time to the operating system for the specified number of milliseconds. The user program is then continued at the location after the call.

ms

Time to be waited in milliseconds

9.3.3 Debug output

The following functions output a value in the debug console. They differ with respect to the data type of the parameter to be passed.

bool VmmDebugOutputString (const char *outstring)	
bool VmmDebugOutputInt (const U32 val)	
boor vienbebugoucpuctine (const 052 var)	
bool VmmDebugOutputByte (const U08 val)	
boor vience ago a const out out out of the second s	
bool VmmDebugOutputHalfWord (const U16 val)	
······································	
bool VmmDebugOutputWord (const U32 val)	
bool VmmDebugOutputFloat (const float val)	

Note

The debug outputs are first written to a separate area of the object dictionary and read from there by the *Plug & Drive Studio*.

This OD entry has index 2600_h and is 64 characters long, see <u>2600h NanoJ Debug Output</u>. Subindex 00 always contains the number of characters already written.

If the buffer is full, VmmDebugOutputxxx() initially fails; execution of the user program ceases and it stops at the location of the debug output. Only after the GUI has read the buffer and after subindex 00 has been reset does the program continue and VmmDebugOutputxxx() returns to the user program.

i

Do not use the debug output if AutoYield mode is activated (see Available computing time).

Note

9.4 Restrictions and possible problems

Restrictions and possible problems when working with NanoJ are listed below:

Restriction/problem	Measure
If an object is mapped, e.g., 0x6040, the object is reset to its previous value every 1 ms. This makes it impossible to control this object via the fieldbus or the <i>Plug & Drive Studio</i> .	<pre>Instead use od_read / od_write to access the object.</pre>
If an object was mapped as output and the value of the object was never defined before starting the <i>NanoJ program</i> , the value of this object may be random.	Initialize the values of the mapped objects in your NanoJ program to ensure that it behaves deterministically.

Restriction/problem	Measure
The array initialization must not be used with more than 16 entries.	Use constant array instead.
float must not be used with comparison operators.	Use int instead.
double must not be used .	
If a NanoJ program restarts the controller (either directly with an explicit restart or indirectly, e. g., through the use of the Reset function), the controller may fall into a restart loop that can be exited only with difficulty if at all.	
math or cmath cannot be included.	

10 Description of the object dictionary

10.1 Overview

This chapter contains a description of all objects.

You will find information here on:

- Functions
- Object descriptions ("Index")
- Value descriptions ("Subindices")
- Descriptions of bits
- Description of the object

10.2 Structure of the object description

The description of the object entries always has the same structure and usually consists of the following sections:

Function

The function of the object dictionary is briefly described in this section.

Object description

This table provides detailed information on the data type, preset values and similar. An exact description can be found in section "<u>Object description</u>"

Value description

This table is only available with the "Array" or "Record" data type and provides exact information about the sub-entries. A more exact description of the entries can be found in section "<u>Value</u> <u>description</u>"

Description

Here, more exact information on the individual bits of an entry is provided or any compositions explained. A more exact description can be found in section "Description"

10.3 Object description

The object description consists of a table that contains the following entries:

Index

Designates the object index in hexadecimal notation.

Object name

The name of the object.

Object Code

The type of object. This can be one of the following entries:

- VARIABLE: In this case, the object consists of only a variable that is indexed with subindex 0.
- ARRAY: These objects always consists of a subindex 0 which specifies the number of subentries – and the sub-entries themselves, beginning with index 1. The data type within an array never changes, i.e., sub-entry 1 and all subsequent entries are always of the same data type.
- RECORD: These objects always consists of a subindex 0 which specifies the number of subentries – and the sub-entries themselves, beginning with index 1. Unlike an ARRAY, the data type of the sub-entries can vary. This means that, e.g., sub-entry 1 may be of a different data type than sub-entry 2.

 VISIBLE_STRING: The object describes a character string coded in ASCII. The length of the string is specified in subindex 0; the individual characters are stored beginning in subindex 1. These character strings are **not** terminated by a null character.

Data type

The size and interpretation of the object is specified here. The following notation is used for the "VARIABLE" object code:

- A distinction is made between entries that are signed; these are designated with the prefix "SIGNED". For entries that are unsigned, the prefix "UNSIGNED" is used.
- The size of the variable in bits is placed before the prefix and can be 8, 16 or 32.

Savable

Described here is whether this object is savable and, if so, in which category.

Firmware version

The firmware version beginning with which the object is available is entered here.

Change history (ChangeLog)

Any changes to the object are noted here.

There are also the following table entries for the "VARIABLE" data type:

Access

The access restriction is entered here. The following restrictions are available:

- "read/write": The object can both be read as well as written
- read only": The object can only be read from the object dictionary. It is not possible to set a value.

PDO mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. Described in this table entry is whether the object can be inserted into a mapping and, if so, into which. The following designations are available here:

- "no": The object may not be entered in a mapping.
- TX-PDO": The object may be entered in an RX mapping.
- "RX-PDO": The object may be entered in a TX mapping.

Allowed values

In some cases, only certain values may be written in the object. If this is the case, these values are listed here. If there are no restrictions, the field is empty.

Preset value

1

To bring the controller to a secured state when switching on, it is necessary to preset a number of objects with values. The value that is written in the object when the controller is started is noted in this table entry.

10.4 Value description

Note

For the sake of clarity, a number of subindices are grouped together if the entries all have the same name.

Listed in the table with the "Value description" heading are all data for sub-entries with subindex 1 or higher. The table contains the following entries:

Subindex

Number of the currently written sub-entry.

Name

Name of the sub-entry.

Data type

The size and interpretation of the sub-entry is specified here. The following notation always applies here:

- A distinction is made between entries that are signed; these are designated with the prefix "SIGNED". For entries that are unsigned, the prefix "UNSIGNED" is used.
- The size of the variable in bits is placed before the prefix and can be 8, 16 or 32.

Access

The access restriction for the sub-entry is entered here. The following restrictions are available:

- "read/write": The object can both be read as well as written
- "read only": The object can only be read from the object dictionary. It is not possible to set a value.

PDO mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. Described in this table entry is whether the sub-entry can be inserted into a mapping and, if so, into which. The following designations are available here:

- "no": The object may not be entered in a mapping.
- "TX-PDO": The object may be entered in an RX mapping.
- "RX-PDO": The object may be entered in a TX mapping.

Allowed values

In some cases, only certain values may be written in the sub-entry. If this is the case, these values are listed here. If there are no restrictions, the field is empty.

Preset value

To bring the controller to a secured state when switching on, it is necessary to preset a number of sub-entries with values. The value that is written in the sub-entry when the controller is started is noted in this table entry.

10.5 Description

This section may be present if use requires additional information. If individual bits of an object or sub-entry have different meaning, diagrams as shown in the following example are used.

Example: The object is 8 bits in size; bit 0 and bit 1 have different functions. Bits 2 and 3 are grouped into one function; the same applies for bits 4 to 7.

7	6	5	4	3	2	1	0
	Exam	ple [4]		Exam	ple [2]	В	А

Example [4]

Description of bit 4 up to and including bit 7; these bits are logically related. The 4 in square brackets specifies the number of related bits. A list with possible values and their description is often attached at this point.

Example [2]

Description of bits 3 and 2; these bits are logically related. The 2 in square brackets specifies the number of related bits.

- Value 00_b: The description here applies if bit 2 and bit 3 are "0".
- Value 01_b: The description here applies if bit 2 is "0" and bit 3 is "1".
- Value 10_b: The description here applies if bit 2 is "1" and bit 3 is "0".
- Value 11_b: The description here applies if bit 2 and bit 3 are "1".

В

Description of bit B; no length is specified for a single bit.

Α

Description of bit A; bits with a gray background are not used.

1000h Device Type

Function

Describes the controller type.

Object description

Index	1000 _h
Object name	Device Type
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	00060192 _h
Firmware version	FIR-v1426
Change history	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Motor Type [16]														
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Device profile number [16]														

Motor Type[16]

Describes the supported motor type. The following values are possible:

- Bit 23 to bit 16: Value "2": BLDC motor
- Bit 23 to bit 16: Value "4": Stepper motor
- Bit 23 to bit 16: Value "6": Stepper motor as well as BLDC motor

Device profile number[16]

Describes the supported CANopen standard.

Values:

 $0192_h \, \text{or} \, 0402_d$ (preset value): The CiA 402 standard is supported.

1001h Error Register

Function

Error register: The corresponding error bit is set in case of an error. If the error no longer exists, it is deleted automatically.

Object description

Index	1001 _h
Object name	Error Register
Object Code	VARIABLE
Data type	UNSIGNED8

Description

General function

If a new error occurs, it is entered in subindex 1. The already existing entries in subindices 1 to 7 are moved back one position. The error in subindex 7 is thereby removed.

The number of errors that have already occurred can be read from the object with subindex 0. If no error is currently entered in the error stack, it is not possible to read one of the eight subindices 1-8 and an error (abort code = 08000024_h) is sent in response. If a "0" is written in subindex 0, counting starts again from the beginning.

Bit description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
			Error Nu	mber [8]						Error C	lass [8]			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
							Error C	ode [16]							

Error Number [8]

This can be used to pinpoint the cause of the error. The meaning of the number can be found in the following table.

Error number	Description
0	Watchdog-Reset
1	Input voltage too high
2	Output current too high
3	Input voltage (+Ub) too low
4	Error at fieldbus
6	CANopen only: NMT master takes too long to send nodeguarding request
7	Sensor 1 (see 3204_{h}): Error through electrical fault or defective hardware
8	Sensor 2 (see 3204 _h): Error through electrical fault or defective hardware
9	Sensor 3 (see 3204_{h}): Error through electrical fault or defective hardware
10	Warning: Positive limit switch exceeded
11	Warning: Negative limit switch exceeded
12	Overtemperature error
13	The values of object <u>6065_h</u> (Following Error Window) and object <u>6066_h</u> (Following Error Time Out) were exceeded; a fault was triggered.
14	Warning: Nonvolatile memory full. The current save process could not be completed; parts of the data of the save process are lost. Controller must be restarted for cleanup work.
15	Motor blocked
16	Warning: Nonvolatile memory damaged; controller must be restarted for cleanup work (all saved objects are reset to default).
17	CANopen only: Slave took too long to send PDO messages.

Error number	Description
18	Sensor n (see $\underline{3204}_h$), where n is greater than 3: Error through electrical fault or defective hardware
19	CANopen only: PDO not processed due to a length error
20	CANopen only: PDO length exceeded
21	Warning: Restart the controller to avoid future errors when saving (nonvolatile memory full/corrupt).
22	Rated current must be set (203B _h :01 _h /6075 _h)
23	Encoder resolution, number of pole pairs and some other values are incorrect.
24	Motor current is too high, adjust the PI parameters.
25	Internal software error, generic
26	Current too high at digital output
27	CANopen only: Unexpected sync length
30	Error in speed monitoring: slippage error too large
32	Internal error: Correction factor for reference voltage missing in the OTP
33	Undervoltage due to voltage connected with reverse polarity
40	Warning: Ballast resistor thermally overloaded
46	Interlock error: Bit 3 in 60FD _h is set to "0", the motor may not start (see the section <i>Interlock function</i> in the chapter <u>Digital inputs</u>)

Error Class[8]

This byte is identical to object 1001_h

Error Code[16]

Refer to the following table for the meaning of the bytes.

Error Code	Description
1000 _h	General error
2300 _h	Current at the controller output too large
3100 _h	Overvoltage/undervoltage at controller input
4200 _h	Temperature error within the controller
5540 _h	Interlock error: Bit 3 in 60FD _h is set to "0", the motor may not start (see the section <i>Interlock function</i> in the chapter <u>Digital inputs</u>)
6010 _h	Software reset (watchdog)
6100 _h	Internal software error, generic
6320 _h	Rated current must be set (203B _h :01 _h /6075 _h)
7113 _h	Warning: Ballast resistor thermally overloaded
7121 _h	Motor blocked
7200 _h	Internal error: Correction factor for reference voltage missing in the OTP
7305 _h	Sensor 1 (see <u>3204_h)</u> faulty
7306 _h	Sensor 2 (see <u>3204_h)</u> faulty
7307 _h	Sensor n (see 3204_{h}), where n is greater than 2
7600 _h	Warning: Nonvolatile memory full or corrupt; restart the controller for cleanup work
8100 _h	Error during fieldbus monitoring

Error Code	Description
8130 _h	CANopen only: "Life Guard" error or "Heartbeat" error
8200 _h	CANopen only: Slave took too long to send PDO messages.
8210 _h	CANopen only: PDO was not processed due to a length error
8220 _h	CANopen only: PDO length exceeded
8240 _h	CANopen only: unexpected sync length
8400 _h	Error in speed monitoring: slippage error too large
8611 _h	Position monitoring error: Following error too large
8612 _h	Position monitoring error: Limit switch exceeded

1008h Manufacturer Device Name

Function

Contains the device name as character string.

Description

Each subindex of the object stands for a certain memory class. By reading out the entry, it is possible to determine whether (value "1") or not (value="0") this memory category can be saved.

To start the save process of a memory category, value " 65766173_h " must be written in the corresponding subindex. This corresponds to the decimal of 1702257011_d or the ASCII string save. As soon as the saving process is completed, the save command is again overwritten with the value "1", since saving is possible again.

For a detailed description, see chapter Saving objects.

1011h Restore Default Parameters

Function

This object can be used to reset all or part of the object dictionary to the default values. See chapter <u>Saving</u> <u>objects</u>.

Object description

Description

If the value $64616F6C_h$ (or 1684107116_d or ASCII load) is written in this object, part or all of the object dictionary is reset to the default values. The subindex that is used decides which range is reset.

For a detailed description, see chapter Discarding the saved data.

1018h Identity Object

Function

This object returns general information on the device, such as manufacturer, product code, revision and serial number.

Object description

Index	1018 _h
Object name	Identity Object
Object Code	RECORD
Data type	IDENTITY
Savable	no
Firmware version	FIR-v1426

1020h Verify Configuration

Function

This object indicates the date and time that the configuration was stored.

A configuration tool or a master can use this object to verify the configuration after a reset and, if necessary, perform a new configuration.

The tool must set the date and time before the storage mechanism is started (see chapter Saving objects).

Object description

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									LLMNR	NBIOS			DHCP		IP

IP

Value = "1": A static IP address from object 2011_h is used and the network mask from object 2012_h is used.

DHCP

Value = "1": IP address assignment using a DHCP server is activated

AUTO

Value = "1": IP address assignment using the AUTO-IP protocol is activated

EXT

Value = "1": The IP address was set externally by NanoFlash and applies only until the controller is restarted again.

NBIOS

Value = "1": The NetBIOS protocol is activated; this is necessary before resolving a hostname (e.g., with a ping command).

LLMNR

Value = "1": The LLMNR protocol is activated; this is necessary before resolving a hostname (e.g., with a ping command).

2011h Static-IPv4-Address

Function

Contains the static IPv4 address in the form of a 32-bit word.

Index	2011 _h
Object name	Static-IPv4-Address
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: Ethernet
Access	read / write
PDO mapping	no
Allowed values	
Preset value	C0A80792 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1450: "Object Name" entry changed from "Static-IP-Address" to "Static-IPv4-Address".
	Firmware version FIR-v1748-B533384: "Savable" entry changed from "yes, category: communication" to "yes, category: Ethernet".

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
IP Address Part 1 [8]								IP Address Part 2 [8]								
15	15 14 13 12 11 10 9 8							7	6	5	4	3	2	1	0	
	IP Address Part 3 [8]									IP	Address	s Part 4	[8]			

IP Address Part 1 [8]

Specifies the first part of the IP address

IP Address Part 2 [8]

Specifies the second part of the IP address

IP Address Part 3 [8]

Specifies the third part of the IP address

IP Address Part 4 [8]

Specifies the fourth part of the IP address

Example

Address 192.168.2.0 is first converted to hexadecimal format, resulting in the following configuration value:

```
192 \implies C0_{h}
168 \implies A8_{h}
2 \implies 02_{h}
0 \implies 0
The corresp
```

The corresponding adjustment value is then $COA80200_h$.

2012h Static-IPv4-Subnet-Mask

Function

Contains the subnet mask of the static IP address in the form of a 32-bit word.

Index	2012 _h
Object name	Static-IPv4-Subnet-Mask
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: Ethernet
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFFF00 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1450: "Object Name" entry changed from "Static-IP-Subnet-Mask" to "Static-IPv4-Subnet-Mask".

Firmware version FIR-v1748-B533384: "Savable" entry changed from "yes, category: communication" to "yes, category: Ethernet".

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Subnet Mask Part 1 [8]									Subnet Mask Part 2 [8]								
15 14 13 12 11 10 9 8 7 6 5									5	4	3	2	1	0			
Subnet Mask Part 3 [8]										Sul	onet Mas	sk Part 4	1 [8]				

Subnet Mask Part 1 [8]

Specifies the first part of the subnet mask

Subnet Mask Part 2 [8]

Specifies the second part of the subnet mask

Subnet Mask Part 3 [8]

Specifies the third part of the subnet mask

Subnet Mask Part 4 [8]

Specifies the fourth part of the subnet mask

Example

The class C network mask 255.255.0 is first converted to hexadecimal format, resulting in the following configuration value:

 $255 \Rightarrow FF_h$

0 => 0

The corresponding adjustment value is then FFFFF00h.

2013h Static-IPv4-Gateway-Address

Function

Contains the static IP gateway address in the form of a 32-bit word.

Index	2013 _h
Object name	Static-IPv4-Gateway-Address
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: Ethernet
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000h
Firmware version	FIR-v1446

Change history

Firmware version FIR-v1512: "Object Name" entry changed from "Static-IP-Gateway-Address" to "Static-IPv4-Gateway-Address".

Firmware version FIR-v1748-B533384: "Savable" entry changed from "yes, category: communication" to "yes, category: Ethernet".

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
IP-Gateway-Address Part 1 [8]									IP-Gateway-Address Part Part 2 [8]								
15	15 14 13 12 11 10 9 8							7	6	5	4	3	2	1	0		
IP-Gateway-Address Part 3 [8]									IP	-Gatewa	ay-Addre	ess Part	Part 4 [[8]			

IP-Gateway-Address Part 1 [8]

Specifies the first part of the IP gateway address

IP-Gateway-Address Part 2 [8]

Specifies the second part of the IP gateway address

IP-Gateway-Address Part 3 [8]

Specifies the third part of the IP gateway address

IP-Gateway-Address Part 4 [8]

Specifies the fourth part of the IP gateway address

Example

Address 192.168.2.0 is first converted to hexadecimal format, resulting in the following configuration value:

$$192 \implies C0_{h}$$

 $168 \implies A8_{h}$
 $2 \implies 02_{h}$
 $0 \implies 0$

The corresponding adjustment value is then COA80200h.

2014h Current-IPv4-Address

Function

Contains the currently active IP address in the form of a 32-bit word.

Index	2014 _h
Object name	Current-IPv4-Address
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no

Access	read only
PDO mapping	no
Allowed values	
Preset value	0000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1450: "Object Name" entry changed from "Current-IP-Address" to "Current-IPv4-Address".

Firmware version	FIR-v1426
Change history	Firmware version FIR-v1540: "Savable" entry changed from "no" to "yes, category: tuning".

2031h Max Motor Current

Function

Enter the maximum permissible motor current in milliamperes here. All current values are limited by this value.

Within the controller, the entered value is always interpreted as the root mean square.

Index	2031 _h
Object name	Max Motor Current
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: tuning
Access	read / write
PDO mapping	no
Allowed values	
Preset value	■ N5-1-3: 000003E8 _h

■ N5-2-3: 00000708_h

FIR-v1426

Firmware version Change history

Firmware version FIR-v1614: "Savable" entry changed from "yes, category: application" to "yes, category: tuning".

Firmware version FIR-v1614: "Object Name" entry changed from "Peak Current" to "Max Current".

Firmware version FIR-v1748-B538662: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".

Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Max Motor Current" to "Maximum Current".

Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".

Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Max Motor Current" to "Maximum Current".

Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".

2034h Upper Voltage Warning Level

Function

This object contains the threshold value for the "overvoltage" error in millivolts.

Object description

Index	2034 _h
Object name	Upper Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	N5-1-3: 0001258A _b
	■ N5-2-3: 0000C78A _b
_	
Firmware version	FIR-v1426
Change history	

Description

If the input voltage of the controller exceeds this threshold value, the motor is switched off and an error triggered. This error is reset automatically if the input voltage is less than (voltage of object 2034_h minus 2 volts).

2035h Lower Voltage Warning Level

Function

This object contains the threshold value for the "Undervoltage" error in millivolts.

Object description

Index	2035 _h
Object name	Lower Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00002710 _h
Firmware version	FIR-v1426
Change history	

Description

If the input voltage of the controller falls below this threshold value, the motor is switched off and an error triggered. The error is reset automatically if the input voltage exceeds the voltage of object 2035_h plus 1.5 volts.

2036h Open Loop Current Reduction Idle Time

Function

This object describes the time in milliseconds that the motor must be at a standstill before current reduction is activated.

Index	2036 _h
Object name	Open Loop Current Reduction Idle Time
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	000003E8 _h
Firmware version	FIR-v1426
Change history	

2037h Open Loop Current Reduction Value/factor

Function

This object describes the rms current to which the motor current is to be reduced if current reduction is activated in open loop (bit 3 in $3202_h = "1"$) and the motor is at a standstill.

Object description

Index	2037 _h
Object name	Open Loop Current Reduction Value/factor
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFFFCEh
Firmware version	FIR-v1426
Change history	

Description

Value of 2037_h greater than or equal to 0 and less than value 6075_h

Current is reduced to the value entered here. The value is in mA and interpreted as root mean square.

Value of 2037_h in the range from -1 to -100

The entered value is interpreted as a percentage and determines the reduction of the rated current in 2037_{h} . The value in 6075_{h} is used for the calculation.

Example: Object $\underline{6075}_h$ has the value 4200 mA. The value -60 in $\underline{2037}_h$ reduces the current by 60% of $\underline{6075}_h$. The result is a current reduction to a root mean square of $\underline{6075}_h * (\underline{2037}_h + 100) / 100 = 1680$ mA.

The value -100 in 2037_h would, for example, mean that a current reduction is set to a root mean square of 0 mA.

2038h Brake Controller Timing

Function

This object contains the times for the *brake control* in milliseconds as well as the PWM frequency and the duty cycle.

Index	2038 _h
Object name	Brake Controller Timing
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Firmware version	FIR-v1426

	Firmware version FIR-v1614: "Data Type" entry changed from "UNSIGNED32" to "INTEGER32".

Value description

Subindex

Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	02 _h
Subindex	01 _h
Name	Minimum Current For Block Detection
Data type	INTEGER32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	■ N5-1-3: 000009C4 _b
	■ N5-2-3: 00001194 _h
Subindex	02 _h
Name	Block Detection Time
Data type	INTEGER32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000C8 _h

The subindices have the following function:

- O1_h: Specifies the current limit value above which blocking is to be detected. Positive numerical values specify the current limit in mA, negative numbers specify a percentage of object <u>2031_h</u>. Example: The value "1000" corresponds to 1000 mA (= 1 A); the value "-70" corresponds to 70% of <u>2031_h</u>.
- 02_h: Specifies the time in ms that the motor is to continue to travel against the block after block detection.

203Bh I2t Parameters

Function

This object contains the parameters for I²t monitoring.

 I^{2} t monitoring is activated by entering a value greater than 0 in <u>203B_h</u>:01 and <u>203B_h</u>:02 and a value greater than 1000 in <u>6073_h</u> (see <u>I2t Motor overload protection</u>).

With one exception, I^2t monitoring can only be used for *closed loop* mode: If I^2t is activated in *open loop* mode, the current is reduced to the smaller of $203B_h:01_h$, 6073_h and 2031_h .

The subindices are divided into two groups: subindex 01_h and 02_h contain parameters for the control, subindices 03_h to 06_h are status values. The functions are as follows:

- 01_h: The rated current specified in the motor data sheet is entered here in mA. This must be smaller than the current entered in <u>2031_h</u> and <u>6073_h</u>, otherwise monitoring is not activated. The specified value is interpreted as root mean square.
- 02_h : Specifies the maximum duration of the maximum current (<u>6073_h</u>) in ms.
- 03_h: Threshold, specifies the limit in mA that determines whether the maximum current or rated current is switched to.
- 04_h: CalcValue, specifies the calculated value that is compared with the threshold for setting the current.
- 05_h: LimitedCurrent, contains the momentary current as root mean square set by I²t.
- 06_h : Current status. If the sub-entry value is "0", I^2 t is deactivated; if the value is "1", I^2 t is activated.

203Dh Torque Window

Function

Specifies a symmetrical range relative to the target torque within which the target is considered having been met.

If the value is set to "FFFFFFF"_h, monitoring is switched off, the "Target reached" bit in object $\underline{6041}_{h}$ (statusword) is never set.

 Change history
 Firmware version FIR-v1614: "Savable" entry changed from "no" to "yes, category: application".

 Firmware version FIR-v1738-B501312: "Object Name" entry changed from "Torque Window Time" to "Torque Window Time Out".

203Fh Max Slippage Time Out

Function

Time in milliseconds until an excessively large slippage error in <u>Profile Velocity</u> mode results in an error message.

Object description

Index	203F _h
Object name	Max Slippage Time Out
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

If the actual speed deviates so much from the set speed that the value (absolute value) of the object $\underline{60F8}_h$ (Max Slippage) is exceeded, bit 13 in object $\underline{6041}_h$ is set. The deviation must last longer than the time in object $\underline{203F}_h$.

A reaction to the slippage error can be set in object 3700_h . If a reaction is defined, an error is also entered in object 1003_h .

2057h Clock Direction Multiplier

Function

The clock count value in <u>Clock-direction mode</u> is multiplied by this value before it is processed further.

Index	2057 _h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														TYPE	VOLT

VOLT

If this bit is set to the value "0", the supply voltage for the encoder is set to 5 V. If the bit is set to the value "1", the supply voltage is set to 24 V.

TYPE

Defines the type of encoder. For a differential encoder, the bit must have the value "0". For a singleended encoder, the bit must be set to "1".

205Ah Absolute Sensor Boot Value (in User Units)

Function

Tip

This object only has a function when using an absolute encoder. If an absolute encoder is not used, the value is always 0.

The initial encoder position when switching on the controller (in <u>user-defined units</u>) can be read from this object.

Index	205A _h

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													AYield		ON

ON

Switches the NanoJ program on (value = "1") or off (value = "0").

With a rising edge in bit 0, the program is first reloaded and the variable range reset.

Note
Startup of the NanoJ program can take up to 200 ms.

When switching on, a check is performed to determine whether a *NanoJ program* is present. If present, "1" is entered in 2300 and the *NanoJ program* is started.

AYield (AutoYield)

If this feature is activated (bit set to "1"), the *NanoJ program* is no longer stopped if it runs longer than it is allowed to. The *NanoJ program* is, thus, no longer real-time capable and no longer runs every 1 ms (see <u>Available computing time</u>).

Note

Do not use the <u>Debug output</u> if *AutoYield* mode is activated.

2301h NanoJ Status

Function

Indicates the operating state of the user program.

Object description

Index	2301 _h						
Object name	NanoJ Status						
Object Code	VARIABLE						
Data type	UNSIGNED32						
Savable	no						
Access	read only						
PDO mapping	TX-PDO						
Allowed values							
Preset value	0000000 _h						
Firmware version	FIR-v1426						
Change history	Firmware version FIR-v1436: "Object Name" entry changed from "VMM Status" to "NanoJ Status".						

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													ERR	RES	RUN

RUN

Value = "0": Program is stopped, value = "1": NanoJ program is running.

RES

Reserved.

ERR

Program was ended with an error. Cause of the error can be read from object $\underline{2302}_{h}$.

2302h NanoJ Error Code

Function

Indicates which error occurred during the execution of the user program.

Object description

Index	2302 _h
Object name	NanoJ Error Code
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1436: "Object Name" entry changed from "VMM Error Code" to "NanoJ Error Code".

Description

Error codes during program execution:

Number	Description
0001 _h	Firmware does not support the used function (e.g., sin, cosin, etc.)
0005 _h	Time Out: Code executed too long without yield() or sleep()
0007 _h	Too many variables on the stack
0100 _h	Invalid NanoJ program file
0101 _h	Invalid NanoJ version of the program file
0102 _h	CRC error in the NanoJ program file

Error when accessing an object:

Number	Description
1xxxxyy _h	Invalid mapping in the NanoJ program file: The value in "xxxx" specifies the index, the value in "yy" specifies the subindex of the object that should – but cannot – be mapped.
2000000 _h	Invalid mapping in the NanoJ program file: too many variables of type input were declared (see <u>2310h NanoJ Input Data Selection</u>)
3000000 _h	Invalid mapping in the NanoJ program file: too many variables of type output were declared (see <u>2320h NanoJ Output Data Selection</u>)
4000000 _h	Invalid mapping in the NanoJ program file: too many variables of type inout were declared (see <u>2330h NanoJ In/output Data Selection</u>)
1000 _h	Access of a nonexistent object in the object dictionary
1001 _h	Write access of a write-protected entry in the OD
1002 _h	An attempt was made to write a value that is too low or too high to an object.
1003 _h	An attempt was made to read out an object that permits only write access.
1FFF _h	Unauthorized access of an object

230Fh Uptime Seconds

Function

This object contains the operating time in seconds since the last time the controller was started.

Note
This object is not stored; counting begins with "0" again after switching on.

Object description

Index	230F _h

	Firmware version FIR-v1540: "Savable" entry changed from "yes category: travel" to "yes, category: movement".

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								Slow	BLDC	Torque	AutoAl	CurRed	Brake	VoS	CL/OL

CL/OL

Changeover between open loop and closed loop (see chapter Control modes)

■ Value = "0": open loop

■ Value = "1": closed loop

Toggling is not possible in the Operation enabled state.

VoS

Value = "1": Simulate V-controller with an S-ramp: simulate the speed modes through continuous position changes

Brake

Value = "1": Switch on automatic brake control.

CurRed (Current Reduction)

Value = "1": Current reduction activated in open loop

AutoAl (auto alignment)

For the case that operation in *closed loop* is required (bit 0 in 3202_h is set).

Value = "1": The *auto alignment* process is activated; immediately after switching on, an alignment is determined in *open loop* and a switch is immediately made to *closed loop* mode without the encoder index having been seen.

The rotor is moved slightly during this process.

Value = "0": No *auto alignment*, the motor operates in *open loop* until the encoder index is seen (maximum one revolution of the motor shaft).

If the incremental encoder used for commutation does not have an index (bit 0 in <u>33A0_h</u> is "0"), an *auto alignment* is always determined.

Torque

only active in operating modes Profile Torque and Cyclic Synchronous Torque

Value = "1": M-controller is active, otherwise a V-controller is superimposed: no V-controller is used in the torque modes for speed limiting, thus object $\underline{6080}_h$ is ignored; $\underline{3210}_h$:3 and $\underline{3210}_h$:4 have no effect on the control.

BLDC

Value = "1": Motor type "BLDC" (brushless DC motor)

Slow (slow speed)

Value = "1": The slow speed mode is activated (closed loop must already be activated)

3203h Feedback Selection

Function

In this object, the sources of the presets are defined for the commutation and the velocity and position control.

A value change in the *Operation enabled* state shows no immediate effect. Value changes in objects are buffered and read out upon changing to the *Operation enabled* state.

Index	3203 _h
Object name	Feedback Selection
Object Code	ARRAY

Data type	UNSIGNED8
Savable	yes, category: tuning
Access	read only
PDO mapping	RX-PDO
Allowed values	
Preset value	
Firmware version	FIR-v1748-B538662
Change history	

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	read only
PDO mapping	RX-PDO
Allowed values	
Preset value	03 _h
Subindex	01 _h
Name	1st Feedback Interface
Data type	UNSIGNED8

Preset value	00 _h
Subindex	03 _h
Name	3rd Feedback Interface
Data type	UNSIGNED8
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00 _h

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- n_h:

Subindex n contains a bit mask for the respective feedback n. The bits have the following meaning here:

- Bit 0: If the bit is set to "1", this sensor is used for position feedback.
- Bit 1: If the bit is set to "1", this sensor is used for velocity feedback.
- Bit 2: If the bit is set to "1", this sensor is used for commutation feedback in <u>Closed Loop</u>.

Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter <u>Configuring the sensors</u>.

Which sensor the controller takes into account for the individual controllers (commutation, velocity, position) is implicitly specified by the order of the sensors.

The search always begins with sensor 2 and continues in ascending order until all existing sensors have been queried. If a sensor is found whose feedback is set, it is assigned to the corresponding controller and the search ended.

Note

If bit 0 in 3202_h is set to "0", *closed loop* is deactivated; bit 2 (commutation) then has no meaning. Bit 1 for the velocity and bit 0 for the position in the respective subindicies are still used for the display of the actual position and speed values.

3204h Feedback Mapping

Function

i.

This object contains information on the existing feedbacks.

Object description

Index	3204 _h
Object name	Feedback Mapping
Object Code	ARRAY
Data type	UNSIGNED16
Savable	no

Allowed values	
Preset value	33A0 _h

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- n_h:

Subindex n refers to the index of the respective object for the configuration of the corresponding feedback.

Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter <u>Configuring the sensors</u>.

320Dh Torque Of Inertia Factor

Function

This factor is used for calculating the acceleration feed forward (see $\underline{320E}_h:08_h$). Default is 0 (feed forward inactive).

Acceleration feed forward applies during deceleration as well.

Object description

Index	320D _h
Object name	Torque Of Inertia Factor
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: drive
Access	read only
PDO mapping	no
Allowed values

Subindex	02 _h
Name	Acceleration
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	0000000 _h

Description

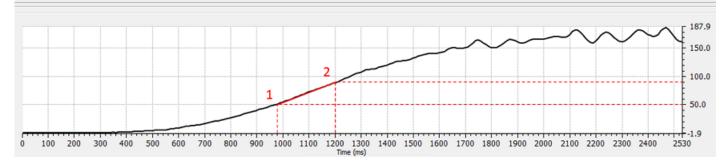

The value is dependent on the inertia of the load. To determine the factor:

- 1. Activate <u>closed loop</u> and select the <u>profile torque</u> mode.
- 2. Set a target for the torque and enter the corresponding current value (mA) in 320Dh:01h.

10 Description of the object dictionary

Record (e. g., in *Plug & Drive Studio*) the current speed (object 606C_h). Calculate the acceleration in the set <u>user-defined units</u> for the speed range, where this is constant. Enter the value in 320D_h:02_h. Using the speed curve in the following figure as an example: (90-50)/(1200-980)=182 rpm/s.

320Eh Closed Loop Controller Parameter

Function

Contains the control parameters for <u>closed loop</u>.

Note

For firmware versions from FIR-v19xx upwards, the new schema for the Controller structure applies.

The old control parameters (object 3210_h) are activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

To use the new parameters, you must set $3210_h:07_h$ (for *closed loop*) or $3210_h:09_h$ (for *open loop*) to "0". The old values are converted and entered in the new object $320E_h$ or $320E_h$. You must save both objects (see <u>Saving objects</u>).

- Subindex 00_h: Number of entries
- Subindex 01_h: Gain factor (proportional component) of the position controller in tenths of a percent
- Subindex 02_h: Reset time (integral component) of the position controller in microseconds
- Subindex 03_h: Speed feed forward in tenths of a percent. Default is 1000 and, thus, a factor of 1.
- Subindex 04_h: Maximum control deviation of the position controller in <u>user-defined units</u>
- Subindex 05_h: Maximum permissible speed of the motor in <u>user-defined units</u>. See <u>6080</u>_h.
- Subindex 06_h: Gain factor (proportional component) of the velocity controller in tenths of a percent
- Subindex 07_h: Reset time (integral component) of the velocity controller in microseconds
- Subindex 08_h: Acceleration feed forward in tenths of a percent of the value of <u>320D_h</u>
- Subindex 09_h: Maximum control deviation of the velocity controller in <u>user-defined units</u>
- Subindex 0A_h: Maximum current in tenths of a percent of the set rated current, see object <u>6073_h</u>
- Subindex 0B_h: Gain factor (proportional component) of the current controller in tenths of a percent
- Subindex 0Ch: Reset time (integral component) of the current controller in microseconds
- Subindex 0D_h: Voltage feed forward in tenths of a percent of the voltage that is needed to produce the rated current
- Subindex 0E_h: Maximum control deviation of the current controller in mA
- Subindex 0F_h: Maximum permissible PWM voltage (duty cycle). Values ≤ 1000 are interpreted as per mil values (of the available voltage). Values > 1000 as millivolt.

Also dependent on this value is whether the *overmodulation* of the voltage vector is used. If *overmodulation* is used, a higher torque can be achieved. The resulting voltage is no longer sinusoidal, which can result in harmonics and higher losses.

Value in mV	Overmodulation
1001U _{o_low}	None; the voltage vector describes a circle.
$U_{o_low}U_{o_high}$	The voltage vector describes a circle that is increasingly flattened on four/six sides in proportion to the set value.
≥U o_high	Full; the voltage vector describes a square or a hexagon.

$U_{o_{low}}$

The lowest voltage above which overmodulation occurs. Is calculated as follows:

With two-phase stepper motors: operating voltage*1.063

With three-phase BLDC motors: operating voltage*0.99

U_{o_high}

The maximum overmodulation occurs above this voltage. Is calculated as follows:

Operating voltage*0.9425

320Fh Open Loop Controller Parameter

Function

i

Contains the control parameters for <u>open loop</u>.

Note

For firmware versions from FIR-v19xx upwards, the new schema for the Controller structure applies.

The old control parameters (object 3210_h) are activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

To use the new parameters, you must set $\underline{3210}_h$:07_h (for *closed loop*) or $\underline{3210}_h$:09_h (for *open loop*) to "0". The old values are converted and entered in the new object $\underline{320E}_h$ or $\underline{320E}_h$. You must save both objects (see <u>Saving objects</u>).

- Subindex 0C_h: (Closed loop) Acceleration feed forward. Default is 0 (feed forward inactive). It applies during deceleration as well.

3212h Motor Drive Flags

Function

This object is used to specify whether or not <u>auto setup</u> is to adapt the controller parameters. The direction of the rotating field can also be changed.

Object description

Index	3212 _h							
Object name	Motor Drive Flags							
Object Code	ARRAY							
Data type	INTEGER8							
Savable	yes, category: application							
Access	read only							
PDO mapping	no

Valid values for subindex 02h:

- Value = "0": Use default values of the firmware
- Value = "1": Force non-inversion of the rotating field (mathematically positive)
- Value = "-1": Force inversion of the rotating field (mathematically negative)

Valid values for subindex 03_h:

- Value = "0": <u>Auto setup</u> detects the motor type (stepper motor or BLDC motor) and uses the corresponding pre-configured parameter set.
- Value = "1": Perform <u>auto setup</u> with the values for the controller that were entered in object <u>3210_h</u> or <u>320E_h</u> before the auto setup; the values in <u>3210_h</u> or <u>320E_h</u> are not changed.

3220h Analog Inputs

Function

Displays the instantaneous values of the analog inputs in ADC digits.

With object $\underline{3221}_h$, the respective analog input can be configured as current or voltage input, if supported by the input.

The subindices have the following function:

<u>3240</u>_h:01_h (Special Function Enable): This bit allows special functions of an input to be switched off (value "0") or on (value "1"). If input 1 is not used as, e.g., a negative limit switch, the special function must be

switched off to prevent an erroneous response to the signal generator. The object has no effect on bits 16 to 31.

The firmware evaluates the following bits:

- Bit 0: Negative limit switch
- Bit 1: Positive limit switch
- Bit 2: Home switch
- □ Bit 3: Interlock

If, for example, two limit switches and one home switch are used, bits 0–2 in 3240_h:01_h must be set to "1".

<u>3240_h:02_h (Function Inverted)</u>: This subindex switches from normally open logic (a logical high level at the input yields the value "1" in object <u>60FD_h</u>) to normally closed logic (the logical high level at the input yields the value "0").

This applies for the special functions (except for the clock and direction inputs) and for the normal inputs. If the bit has the value "0", normally open logic applies; for the value "1", normally closed logic applies. Bit 0 changes the logic of input 1, bit 1 changes the logic of input 2, etc.

- <u>3240</u>_h:03_h (Force Enable): This subindex switches on the software simulation of input values if the corresponding bit is set to "1".
 In this case, the actual values are no longer used in object <u>3240</u>_h:04_h, but rather the set values for the respective input. Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.
- 3240_h:04_h (Force Value): This bit specifies the value that is to be read as the input value if the same bit was set in object <u>3240_h</u>:03_h.
- 3240_h:05_h (Raw Value): This object contains the unmodified input value.
- 3240_h:06_h (Input Range Select): This can be used to switch inputs that are equipped with this function from the switching threshold of 5 V (bit is "0") to the switching threshold of 24 V (bit is "1"). Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.
- 3240_h:07_h (Differential Select): With the inputs, this subindex switches between "single-ended input" (value "0" in the subindex) and "differential input" (value "1" in the subindex) if the input supports this function.
- 3240_h:08_h (Routing Enable): The value "1" in this subindex activates Input Routing.

3242h Digital Input Routing

Function

This object determines the source of the input routing that ends in 60FD_h.

Object description

Index	3242 _h
Object name	Digital Input Routing
Object Code	ARRAY
Data type	UNSIGNED8

Access	read / write			
PDO mapping	TX-PDO			
Allowed values				
Preset value	00 _h			

Subindex 01_h contains the source for bit 0 of object <u>60FD</u>. Subindex 02_h contains the source for bit 1 of object <u>60FD</u> and so on.

The number that is written in a subindex determines the source for the corresponding bit. The following table lists all possible signal sources.

Nu	ımber			
dec	hex		Signal source	
00	00	Signal is always 0		
01	01	Physical input 1		
02	02	Physical input 2		
03	03	Physical input 3		
04	04	Physical input 4		
05	05	Physical input 5		
06	06	Physical input 6		
07	07	Physical input 7		
08	08	Physical input 8		
09	09	Physical input 9		
10	0A	Physical input 10		
11	0B	Physical input 11		
12	0C	Physical input 12		
13	0D	Physical input 13		
14	0E	Physical input 14		
15	0F	Physical input 15		
16	10	Physical input 16		
65	41	Hall input "U"		
66	42	Hall input "V"		
67	43	Hall input "W"		
68	44	Encoder input "A"		
69	45	Encoder input "B"		

Number		
dec	hex	Signal source
70	46	Encoder input "Index"
72	48	"Ethernet active" status
128	80	Signal is always 1
129	81	Inverted physical input 1

139	8B	Inverted physical input 11
140	8C	Inverted physical input 12
141	8D	Inverted physical input 13
142	8E	Inverted physical input 14
143	8F	Inverted physical input 15
144	90	Inverted physical input 16
193	C1	Inverted Hall input "U"
194	C2	Inverted Hall input "V"
195	C3	Inverted Hall input "W"
196	C4	Inverted encoder input "A"
197	C5	Inverted encoder input "B"
198	C6	Inverted encoder input "Index"
200	C8	"Ethernet active" inverted status

3243h Digital Input Homing Capture

Function

With this object, the current position can be noted automatically if a level change occurs at the digital input that is used for the home switch.

Note

Do not use this function in combination with a homing operation. The homing operation cannot otherwise be successfully completed.

Object description

- Subindex 01_h: This is used to select the type of level change:
 - Deactivate function: Value "0"
 - □ With rising edge: Value "1"
 - □ With falling edge: Value "2"
 - □ Both edges: Value "3"
- Subindex 02_h: Specifies the number of the noted level changes since the time the function was started; is
 reset to 0 if subindex 01_h is set to 1,2 or 3
- Subindex 03_h: Encoder position of the level change (in absolute user units from <u>6064_h</u>)
- Subindex 04_h: Encoder position of the level change

3250h Digital Outputs Control

Function

This object can be used to control the digital outputs as described in chapter " Digital inputs and outputs".

The following applies for all subindices:

- Bits 0 to 15 control the special functions.
- Bits 16 to 31 control the level of the outputs.

The subindices have the following function:

- 01_h: No function.
- 02_h: This subindex is used to invert the logic (from normally closed logic to normally open logic).

- 03_h: This subindex is used to force the output value if the bit has the value "1". The level of the output is defined in subindex 4_h.
- 04_h: This subindex is used to define the level to be applied to the output. The value "0" returns a logical low level at the digital output; the value "1", on the other hand, returns a logical high level.
- $\hfill 05_h$: The bit combination applied to the outputs is stored in this subindex.
- 08_h: If the subindex is set to "1", *Output Routing* is activated.

Note Entries $3250_{h}:01_{h}$ to $3250:04_{h}$ then have **no** function until *Output Routing* is again switched off.

09_h: For switching control of the <u>Power LED</u> on/off. If bit 0 is set to "1", the green LED is activated (flashes in normal operation). If bit 1 is set to "1", the red LED is activated (flashes in case of an error). If the bit is set to "0", the respective LED remains off.

3252h Digital Output Routing

Function

i

This object assigns a signal source to an output; this signal source can be controlled with 60FE_h.

The user-defined units are made up of offset (3321_h) and scaling value $(3322_h/3323_h)$. If both are still set to the default values, the value in 3320_h is specified in the *ADC Digits* unit.

Formula for converting from digits to the respective unit:

- Voltage input: (x digits 512 digits) * 20 V / 1023 digits
- Current input (if configurable): x digits * 20 mA / 1023 digits

The following applies for the sub-entries:

- Subindex 00_h: Number of analog inputs
- Subindex 01_h: Analog value 1
- Subindex 02_h: Analog value 2 (if present)

3321h Analogue Input Offset

Function

Offset that is added to the read analog value (3220_h) before scaling (multiplier from object 3322 and divisor from object 3323_h).

Description

The subindices have the following function:

- 01_h (Configuration): The following bits have a meaning:
 - □ Bit 0: Value = "0": The encoder does not have an index. Value = "1": Encoder index exists and is to be used.
- 02_h (Alignment): This value specifies the offset between the index of the encoder and the rotor's magnets. The exact determination is possible via <u>auto setup</u>. The presence of this value is necessary for *closed loop* mode with encoder.

3501h EtherNetIP Rx PDO Mapping

Function

A

The objects for RX mapping can be written in this object.

To be able to change the mapping, you must first deactivate it by setting subindex 0_h to "0". After writing the objects to the respective subindices, enter the number of mapped objects in subindex 0_h .

Note

Object description

Index	3501 _h
Object name	EtherNetIP Rx PDO Mapping
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	
Firmware version	FIR-v1748-B538662
Change history	

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	read / write
PDO mapping	no
Allowed values	
Preset value	20 _h
Subindex	01 _h
Name	1st Object To Be Mapped
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	22910120 _h
Subindex	02 _h
Name	2nd Object To Be Mapped

Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	00040040
Preset value	22910210 _h
Subindex	03 _h
Name	3rd Object To Be Mapped
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	22910308 _h
Subindex	04 _h
Name	4th Object To Be Mapped
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	22910408 _h
Subindex	05 _h
Subindex Name	05 _h 5th Object To Be Mapped

3601h EtherNetIP Tx PDO Mapping

Function

G

The objects for TX mapping can be written in this object.

Note

To be able to change the mapping, you must first deactivate it by setting subindex 0_h to "0".

After writing the objects to the respective subindices, enter the number of mapped objects in subindex 0_h .

3700h Deviation Error Option Code

Function

The object contains the action that is to be executed if a following or slippage error is triggered.

Object description

Index	3700 _h
Object name	Deviation Error Option Code
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFF _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1738-B501312: "Object Name" entry changed from "Following Error Option Code" to "Deviation Error Option Code".

Description

Value		Description	
-327681	Reserved		

Value	Description
0	Blocking of the drive function – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (<u>6085_h)</u>
3 32767	Reserved

3701h Limit Switch Error Option Code

Function

If a limit switch is passed over, bit 7 (*Warning*) is set in $\underline{6041}_h$ (*statusword*) and the action that is stored in this object executed.

Object description

Index	3701 _h
Object name	Limit Switch Error Option Code
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFF _h
Firmware version	FIR-v1748-B538662
Change history	

Description

	Value in object 3701 _h	Description
-1		No reaction (e.g., to execute a homing operation)
1		Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>
2		Braking with <i>quick stop ramp</i> and subsequent state change to Switch on disabled
5		Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.
6		Braking with <i>quick stop ramp</i> and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

Note

The quick-stop bit (bit 2) in 6040_h is not automatically set to "0" when the state changes to *Quick stop active*.

▶ If you want to change the <u>state machine</u> back to the Operation enabled state, you must set the bit to "0" and then to "1" again.

4012h HW Information

Function

 (\mathbf{i})

This object contains information about the hardware.

Object description

Index	4012 _h
Object name	HW Information
Object Code	ARRAY
Data type	UNSIGNED32

The subindices have the following functions:

- 01_h: Version of the boot loader. The 4 most significant bytes contain the main version number; the 4 least significant bytes contain the minor version number. Example for version 4.2: 00040002_h
- 02_h: Fieldbuses supported by the boot loader. The bits have the same function as the bits of object <u>2101h</u> <u>Fieldbus Module Availability</u>.

603Fh Error Code

Function

This object returns the error code of the last error that occurred.

It corresponds to the lower 16 bits of object 1003_h . For the description of the error codes, refer to object 1003_h .

Object description

Index	603F _h
Object name	Error Code
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

Description

For the meaning of the error, see object 1003_h (Pre-defined Error Field).

6040h Controlword

Function

This object controls the CiA 402 Power State Machine.

Object description

Index	6040 _h
Object name	Controlword
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Description

Parts of the object are, with respect to function, dependent on the currently selected mode.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
						OMS	HALT	FR		OMS [3]		EO	QS	EV	SO

SO (Switched On)

Value = "1": Switches to the "Switched on" state

EV (Enable Voltage)

Value = "1": Switches to the "Enable voltage" state

QS (Quick Stop)

Value = "0": Switches to the "Quick stop" state

EO (Enable Operation)

Value = "1": Switches to the "Enable operation" state

OMS (Operation Mode Specific)

Meaning is dependent on the selected operating mode

FR (Fault Reset)

Resets an error (if possible)

HALT

Value = "1": Triggers a halt; valid in the following modes:

- Profile Position
- Velocity
- Profile Velocity
- Profile Torque
- Interpolated Position Mode

6041h Statusword

Function

This object returns information about the status of the CiA 402 Power State Machine.

Object description

Index	6041 _h
Object name	Statusword
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

Description

Parts of the object are, with respect to function, dependent on the currently selected mode. Refer to the corresponding section in chapter <u>Operating modes</u>.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLA		OMS	S [2]	ILA	TARG	REM	SYNC	WARN	SOD	QS	VE	FAULT	OE	SO	RTSO

RTSO (Ready To Switch On)

Value = "1": Controller is in the "Ready to switch on" state

SO (Switched On)

Value = "1": Controller is in the "Switched on" state

OE (Operation Enabled)

Value = "1": Controller is in the "Operation enabled" state

FAULT

Error occurred (see 1003_h)

VE (Voltage Enabled)

Voltage applied

QS (Quick Stop)

Value = "0": Controller is in the "Quick stop" state

SOD (Switched On Disabled)

Value = "1": Controller is in the "Switched on disabled" state

WARN (Warning)

Value = "1": Warning

SYNC (synchronization)

Value = "1": Controller is in sync with the fieldbus; value = "0": Controller is not in sync with the fieldbus

REM (Remote)

Remote (value of the bit is always "1")

TARG

Target reached

ILA (Internal Limit Active)

Limit exceeded

OMS (Operation Mode Specific)

Meaning is dependent on the selected operating mode

CLA (Closed Loop Active)

Value = "1": The controller is in the *Operation enabled* state and the <u>Closed Loop</u> is activated.

Listed in the following table are the bit masks that break down the state of the controller.

Statusword (6041 _h)	State
xxxx xxxx x0xx 0000	Not ready to switch on
xxxx xxxx x1xx 0000	Switch on disabled
xxxx xxxx x01x 0001	Ready to switch on
xxxx xxxx x01x 0011	Switched on
xxxx xxxx x01x 0111	Operation enabled
xxxx xxxx x00x 0111	Quick stop active
xxxx xxxx x0xx 1111	Fault reaction active
xxxx xxxx x0xx 1000	Fault

6042h VI Target Velocity

Function

Specifies the target speed in <u>user-defined units</u> for <u>Velocity</u> mode.

Index	6042 _h
Object name	VI Target Velocity
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00C8 _h
Firmware version	FIR-v1426

Change history

Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

6043h VI Velocity Demand

Function

Speed specification in <u>user-defined units</u> for the controller in <u>Velocity</u> mode.

Object description

Index	6043 _h
Object name	VI Velocity Demand
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

6044h VI Velocity Actual Value

Function

Specifies the current actual speed in <u>user-defined units</u> in <u>Velocity</u> mode.

Object description

Index	6044 _h
Object name	VI Velocity Actual Value
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h

Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000h
Subindex	02 _h
Name	MaxAmount
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00007530 _h

Description

Subindex 1 contains the minimum speed.

Subindex 2 contains the maximum speed.

If the value of the target speed (object $\underline{6042}_h$) specified here is less than the minimum speed, the minimum speed applies and bit 11 (Internal Limit Reached) in $\underline{6041h}$ Statusword_h is set.

A target speed greater than the maximum speed sets the speed to the maximum speed and bit 11 (Internal Limit Reached) in 6041h Statusword_h is set.

6048h VI Velocity Acceleration

Function

Sets the acceleration ramp in Velocity Mode (see <u>Velocity</u>).

Object description

Index	6048 _h
Object name	VI Velocity Acceleration
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION
Savable	yes, category: application

6065h Following Error Window

Function

Defines the maximum allowed following error in user-defined units symmetrically to the demand position.

Object description

Index	6065 _h
Object name	Following Error Window
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000100 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the actual position deviates so much from the demand position that the value of this object is exceeded, bit 13 in object $\underline{6041}_h$ is set. The deviation must last longer than the time in object $\underline{6066}_h$.

If the value of the "Following Error Window" is set to "FFFFFFF"_h, following error monitoring is switched off.

A reaction to the following error can be set in object $\underline{3700}_h$. If a reaction is defined, an error is also entered in object $\underline{1003}_h$.

6066h Following Error Time Out

Function

Time in milliseconds until a larger following error results in an error message.

Index	6066 _h
Object name	Following Error Time Out
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1426

Change history

Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the actual position deviates so much from the demand position that the value of object 6065_h is exceeded, bit 13 in object 6041_h is set. The deviation must persist for longer than the time defined in this object.

A reaction to the following error can be set in object $\underline{3700}_h$. If a reaction is defined, an error is also entered in object $\underline{1003}_h$.

6067h Position Window

Function

Specifies a range symmetrical to the target position within which that target is considered having been met in modes <u>Profile Position</u> and <u>Interpolated Position Mode</u>.

Object description

Index	6067 _h
Object name	Position Window
Object Code	VARIABLE
Data type	UNSIGNED32

Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object $203B_{h}$:01.

The minimum of $\underline{6073}_h$ and $\underline{6072}_h$ is used as limit for the torque in $\underline{6071}_h$.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

6072h Max Torque

Function

The object describes the maximum torque for the <u>Profile Torque</u> and <u>Cyclic Synchronous Torque</u> modes in tenths of a percent of the rated torque.

Object description

Index	6072 _h
Object name	Max Torque
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1426
Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object $203B_h$:01.

The minimum of $\underline{6073}_{h}$ and $\underline{6072}_{h}$ is used as limit for the torque in $\underline{6071}_{h}$.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

6073h Max Current

Function

Contains the maximum current in tenths of a percent of the set rated current entered in $\underline{320E}_h:OA_h$. Is limited by the maximum motor current ($\underline{2031}_h$). See also <u>12t Motor overload protection</u>.

For stepper motors, only the rated current is specified, not a maximum current. The value of 6073_h should therefore not exceed the value 1000 (100%).

Note

Index	6073 _h
Object name	Max Current
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: drive
Access	read / write
PDO mapping	RX-PDO
Allowed values	

Preset value	03E8 _h
Firmware version	FIR-v1825-B577172
Change history	

The maximum current is calculated in tenths of a percent of the rated current as follows:

(6073h*203Bh:01)/1000

The maximum current determines:

- the maximum current for the <u>I2t Motor overload protection</u>
- the rated current in open loop mode

i

Note

The maximum current also affects the control behavior in *closed loop* mode (see <u>Controller structure</u>). If you change the maximum current, you must also proportionally adjust the value of $320E_h$:09_h.

6074h Torque Demand

Function

Current torque set value requested by the ramp generator in tenths of a percent of the rated torque for the internal controller.

Object description

Index	6074 _h
Object name	Torque Demand
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h

Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object $203B_{h}$:01.

The minimum of $\underline{6073}_h$ and $\underline{6072}_h$ is used as limit for the torque in $\underline{6071}_h$.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

6075h Motor Rated Current

Function

Contains the rated current entered in $\underline{203B}_h:01_h$ in mA.

6077h Torque Actual Value

Function

This object indicates the current torque value in tenths of a percent of the rated torque for the internal controller.

Object description

Index	6077 _h

Firmware version	FIR-v1426
Change history	Firmware version FIR-v1738-B501312: "PDO mapping" table entry for subindex 00 changed from "no" to "RX-PDO".

The following generally applies for direction reversal: If a bit is set to the value "1", reversal is activated. If the value is "0", the direction of rotation is as described in the respective mode.

7	6	5	4	3	2	1	0	
POS	VEL							

VEL (Velocity)

Direction of rotation reversal in the following modes:

- Profile Velocity Mode
- <u>Cyclic Synchronous Velocity Mode</u>

POS (Position)

Direction of rotation reversal in the following modes:

- Profile Position Mode
- <u>Cyclic Synchronous Position Mode</u>

Tip

You can force an inversion of the rotary field that affects all operating modes. See object <u>3212_h:02_h</u>.

607Fh Max Profile Velocity

Function

Specifies the maximum speed in <u>user-defined units</u> for which the Mod i <u>Profile Position</u>, <u>Interpolated Position</u> <u>Mode</u> (only if <u>closed loop</u> is activated) and <u>Profile Velocity</u>.

Index	607F _h

The speed for the search for the switch is specified in subindex 1.

The (lower) speed for the search for the reference position is specified in subindex 2.

- The speed in subindex 2 is simultaneously the initial speed when starting the acceleration ramp. If this is set too high, the motor loses steps or fails to turn at all. If the setting is too high, the index marking will be overlooked. The speed in subindex 2 should therefore be less than 1000 steps per second.
- The speed in subindex 1 must be greater than the speed in subindex 2.

609Ah Homing Acceleration

Function

i

Specifies the acceleration ramp for homing mode in user-defined units.

Index	609A _h
Object name	Homing Acceleration
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	000001F4 _h
Firmware version	FIR-v1426
Change history	

The ramp is only used when starting up. When the switch is reached, the motor immediately switches to the lower speed; when the end position is reached, it immediately stops.

60A2h Jerk Factor

Function

This object contains the factor that is used for converting from user-defined jerk units. See chapter <u>User-defined units</u>.

Object description

Index	60A2 _h
Object name	Jerk Factor

· • • · · · · · · · · · · · · · · · · ·	
Allowed values	

The value of subindex 01_h contains the maximum possible number of interpolated records.

The value of subindex 02_h contains the current number of interpolated records.

If subindex 03_h is " 00_h ", this means a FIFO buffer organization; if it is " 01_h ", it specifies a ring buffer organization.

The value of subindex 04_h is unitless and specifies the next free buffer entry point.

The value of subindex 05_h is specified in units of "byte".

If the value $"00_h"$ is written in subindex 06_h , it deletes the received data in the buffer, deactivates access and deletes all interpolated records.

If the value $"01_h"$ is written in subindex 06_h , it activates access to the input buffer.

60C5h Max Acceleration

Function

This object contains the maximum permissible acceleration for the <u>Profile Position</u> and <u>Profile Velocity</u> modes.

	Feedback Interface #1 - #3
Data type	INTEGER32
Data type Access	INTEGER32 read / write
Access	read / write
Access PDO mapping	read / write

Description

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- ∎ n_h:

Subindex n contains the number of increments of the corresponding feedback. Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter <u>Configuring the sensors</u>.

The resolution of feedback "n" is calculated as follows:

Position Encoder Resolution = Encoder Increments $(60E6_h:01_h)$ / Motor Revolutions $(60EB_h:02_h)$

The value "0" in a subindex means that the respective feedback is not connected and is not used. Thus, it is possible, for example, to switch off the sensorless function to save computing time.

Tip

This can be helpful if a *NanoJ* program needs the computing time.

60E8h Additional Gear Ratio - Motor Shaft Revolutions

Function

In this object and in <u>60ED_h</u>, you can set the gear ratio of each existing feedback.

Description

Only the following bits are supported at the present time:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MS	RES	SERVED	0 [3]		IP OPT	ION [4]		RAD	O [2]	RRO	D [2]	CIC	0 [2]	REL. C	OPT. [2]

REL. OPT. (Relative Option)

These bits determine the behavior with relative rotating movement in "profile position" mode if bit 6 of controlword $\underline{6040}_{h} = "1"$ is set.

Bit 1	Bit 0	Definition
0	0	Position movements are executed relative to the previous (internal absolute) target position (each relative to 0 if there is no previous target position)
0	1	Position movements are executed relative to the preset value (or output) of the ramp generator.
1	0	Position movements are performed relative to the current position (object 6064_{h}).
1	1	Reserved

RRO (Request-Response Option)

These bits determine the behavior when passing controlword $\underline{6040}_h$ bit 4 ("new setpoint") – in this case, the controller releases the bit itself. This eliminates the need to externally reset the bit to "0"

afterwards. After the bit is set to the value "0" by the controller, bit 12 ("setpoint acknowledgment") is also set to the value "0" in statusword $\frac{6041}{h}$.

Note

These options cause the controller to modify object controlword 6040h.

Bit 5	Bit 4	Definition
0	0	The functionality is as described under Setting travel commands.
0	1	The controller releases the "new setpoint" bit as soon as the current targeted movement has reached its target.
1	0	The controller releases the "new setpoint" bit as soon this is possible for the controller.
1	1	Reserved

RADO (Rotary Axis Direction Option)

These bits determine the direction of rotation in "profile position" mode.

Bit 7	Bit 6	Definition
0	0	Normal positioning similar to a linear axis: If one of the "Position Range Limits" $- \frac{607B_h}{101_h}$ and $02_h -$ is reached or exceeded, the preset is automatically transferred to the other end of the limit. Only with this bit combination is a movement greater than the modulo value possible.
0	1	Positioning only in negative direction: If the target position is greater than the current position, the axis moves to the target position via the "Min Position Range Limit" from object <u>607D</u> _h :01 _h .
1	0	Positioning only in positive direction: If the target position is less than the current position, the axis moves to the target position via the "Max Position Range Limit" from object <u>607D</u> h:01h.
1	1	Positioning with the shortest distance to the target position. If the difference between the current position and the target position in a 360° system is less than 180°, the axis moves in the positive direction.

60F4h Following Error Actual Value

Function

This object contains the current following error in user-defined units.

Index	60F4 _h
Object name	Following Error Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no

Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

60F8h Max Slippage

Function

Defines the maximum allowed slippage error in <u>user-defined units</u> symmetrically to the <u>set speed</u> in <u>Profile</u> <u>Velocity</u> mode.

Object description

Index	60F8 _h
Object name	Max Slippage
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000190 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

If the actual speed deviates so much from the set speed that the value (absolute value) of this object is exceeded, bit 13 in object $\underline{6041}_h$ is set. The deviation must last longer than the time in object $\underline{203F}_h$.

If the value of 60F8_h is set to "7FFFFFF"_h, slippage error monitoring is switched off.

A reaction to the slippage error can be set in object 3700_h . If a reaction is defined, an error is also entered in object 1003_h .

60FAh Control Effort

Function

This object contains the correction speed (control variable) in <u>user-defined units</u> that is fed to the velocity controller by the position controller.

Index	60FA _h
Object name	Control Effort
Object Code	VARIABLE
Data type	INTEGER32
Savable	no

Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1748-B531667
Change history	

The position controller calculates a correction speed (in <u>user-defined units</u>) from the difference between the current position and the demand position which is then passed on to the velocity controller. This correction value is dependent on the proportional component and integral component of the position controller. See also chapter <u>Closed Loop</u>.

60FCh Position Demand Internal Value

Function

Indicates the current preset value for the position controller in increments of the sensor selected for the position (see <u>Controller structure</u>).

Object description

Index	60FC _h
Object name	Position Demand Internal Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000000 _h
Firmware version	FIR-v1738-B501312
Change history	

60FDh Digital Inputs

Function

With this object, the digital inputs of the motor can be read.

Object description

Index	60FD _h
Object name	Digital Inputs
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000000 _h
Firmware version	FIR-v1426
Change history	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
								IN 8	IN 7	IN 6	IN 5	IN 4	IN 3	IN 2	IN 1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												IL	HS	PLS	NLS

NLS (Negative Limit Switch)

Negative limit switch

PLS (Positive Limit Switch)

Positive limit switch

HS (Home Switch)

Home switch

IL (Interlock)

Interlock

IN n (Input n)

Input n – the number of used bits is dependent on the given controller.

60FEh Digital Outputs

Function

With this object, the <u>digital outputs</u> of the motor can be written.

Index	60FE _h
Object name	Digital Outputs
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Firmware version	FIR-v1426

Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to
	"yes, category: application".

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	01 _h
Subindex	01 _h
Name	Digital Outputs #1
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000001 _h

Description

To write the outputs, the entries in object 3250_h , subindex 02_h to 05_h , must also be taken into account.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
												OUT4	OUT3	OUT2	OUT1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
															BRK

BRK (Brake)

Bit for the brake output (if the controller supports this function):

Value "1" means that the brake is activated (no current can flow between the two pins of the brake connection; the brake is closed).

OUT n (Output No n)

Bit for the respective digital output; the exact number of digital outputs is dependent on the controller.

60FFh Target Velocity

Function

In this object, the target speed for the profile velocity and cyclic synchronous velocity modes is entered in user-defined units.

Object description

Index

 $60 \mathrm{FF}_{\mathrm{h}}$

Object name	Target Velocity
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

6502h Supported Drive Modes

Function

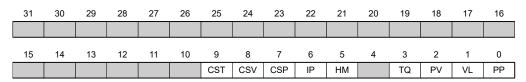

The object describes the supported operating modes in object 6060h.

Object description

Index	6502 _h
Object name	Supported Drive Modes
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	000002F _h
Firmware version	FIR-v1426
Change history	

Description

The set bit specifies whether the respective mode is supported. If the value of the bit is "0", the mode is not supported.

CST

Cyclic Synchronous Torque Mode

6503h Drive Catalogue Number

Function

Contains the device name as character string.

Object description

Index	6503 _h
Object name	Drive Catalogue Number
Object Code	VARIABLE
Data type	VISIBLE_STRING
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	0
Firmware version	FIR-v1426
Change history	

6505h Http Drive Catalogue Address

Function

This object contains the manufacturer's web address as a character string.

Index	6505 _h
Object name	Http Drive Catalogue Address
Object Code	VARIABLE

10 Description of the object dictionary

Data type	VISIBLE_STRING
Savable	no
Access	read only
PDO mapping	no
